The OBPS component came into effect in Ontario on January 1, 2019 and ended on December 31, 2021. Under OBPS, a registered facility has a compliance obligation for the portion of their emissions that exceeds their annual facility emissions limit, which is calculated based on the sector specific output-based standard and annual production. From 2019 to 2021, Enbridge Gas was registered with ECCC as an emitter in the OBPS program and has an annual compliance obligation associated with the combustion and flaring emissions from its natural gas pipeline transmission system. As a registered facility under OBPS, Enbridge Gas submitted an annual report along with the required verification report from an accredited third-party verifier who found no material misstatements. Enbridge Gas was required to remit payment for facility emissions that exceed its annual facility emissions limit by December of the year following a compliance period. In accordance with the regulations, Enbridge Gas made payment for the 2021 compliance obligation in December 2022.

In September 2020, Ontario and the federal government announced that the federal government has accepted that Ontario's Emission Performance Standards (EPS) will replace the federal OBPS for industrial facilities. In March 2021, the federal government announced that the federal OBPS would stand down in Ontario at the end of 2021 and Ontario would transition to the EPS effective January 1, 2022. In September 2021, the Greenhouse Gas Pollution Pricing Act was amended to remove Ontario as a covered province, enabling the EPS to take effect on January 1, 2022. Effective January 1, 2022, Enbridge Gas transitioned out of the federal OBPS to the provincial EPS. Enbridge Gas is registered with the Ministry of the Environment, Conservation and Parks as a covered facility under the EPS and has an annual compliance obligation for its facility-related stationary combustion and flaring emissions associated with its transmission and storage operations. Enbridge Gas must remit payment annually on the portion of emissions that exceed its total annual emissions limit. Payment is due the year following a compliance period and as such, Enbridge Gas will remit payment for its 2022 EPS compliance obligation in 2023.

Enbridge Gas applies to the OEB annually through a Federal Carbon Pricing Program application for approval of just and reasonable rates effective April 1 each year for the Enbridge Gas Distribution Inc. and Union rate zones, to recover the costs associated with the Federal Carbon Charge and EPS Regulation as a pass-through to customers.

Renewable Power Generation

In March 2022, the Federal Government of Canada released a white paper setting out its plans for caps on emissions on Canada's electricity grid with the intention of reaching a net-zero grid by 2035. The government subsequently proposed a CE Regulation framework and provided technical details for the program, which would cap emissions from electricity generation sources at, or near zero tCO_2e per megawatt hour. Details of related compliance payments and potential credit generation opportunities are under review and the CE Regulation is expected to come into effect in 2023. Enbridge's Renewable Power Generation resources are substantially non-emitting.

HUMAN CAPITAL RESOURCES

WORKFORCE SIZE AND COMPOSITION

As at December 31, 2022, we had approximately 11,100 regular employees, including approximately 1,600 unionized employees across our North American operations. This total rises to just over 13,000 if temporary employees and contractors are included. We have a strong preference for direct employment relationships but where we have collectively bargained-for employees, we have mature working relationships with our labor unions and the parties have traditionally committed themselves to the achievement of renewal agreements without a work stoppage.

SAFETY

We believe all injuries, incidents and occupational illnesses are preventable. Our overall focus on employee and contractor safety, including through the COVID-19 pandemic, continues to result in strong performance compared against industry benchmarks and we are actively engaged in continuous improvement exercises as we pursue our goal of zero incidents.

DIVERSITY, EQUITY AND INCLUSION

In 2020, we announced Enbridge's ESG goals – including goals to increase representation of women, underrepresented ethnic and racial groups (including Indigenous peoples), people with disabilities and veterans – to ensure our workforce is reflective of the communities where we operate. In executing on our ESG strategy, we continue to track progress towards these representation goals in 2022. Consistent with our culture, we remain committed to open, two-way dialogue related to our goals, enhancing transparency and accountability for all stakeholders.

Diversity Representation Goals

Workforce comprised of **40%** **women** by 2025

28% from **underrepresented ethnic and racial groups** in our workforce by 2025

7% workplace representation of **U.S. protected veterans** by 2025

6% **People with disabilities** included in our workforce by 2025

3.5% **representation** within our workforce of **Indigenous people** by 2025

PRODUCTIVITY AND DEVELOPMENT

We continually invest in our people's personal and professional development because we recognize their success is our success. Every year, employees are provided access to a range of development and re-skilling opportunities through a variety of channels, including: extensive catalog of self-directed learning (10,000+ external courses plus proprietary Enbridge University courses); on-the-job learning opportunities and rotational assignments; curated leadership development programs; educational reimbursement; and developmental relationships with mentors through our formal mentor-protégé matching program.

EXECUTIVE OFFICERS

The following table sets forth information regarding our executive officers as at February 10, 2023:

Name	Age	Position
Gregory L. Ebel	58	President & Chief Executive Officer
Vern D. Yu	56	Executive Vice President, Corporate Development, Chief Financial Officer & President, New Energy Technologies
Colin K. Gruending	53	Executive Vice President & President, Liquids Pipelines
Cynthia L. Hansen	58	Executive Vice President & President, Gas Transmission and Midstream
Byron C. Neiles	57	Executive Vice President & Chief Administrative Officer
Robert R. Rooney	66	Executive Vice President & Chief Legal Officer
Matthew A. Akman	55	Senior Vice President, Corporate Strategy & President, Power
Michele E. Harradence	54	Senior Vice President & President, Gas Distribution
Laura J. Sayavedra	55	Senior Vice President, Safety & Reliability, Projects and Unify

Gregory L. Ebel was appointed President and Chief Executive Officer on January 1, 2023. Mr. Ebel is also a member of the Enbridge Board of Directors. Mr. Ebel served as Chair of the Enbridge Board of Directors following the merger of Enbridge and Spectra Energy Corp (Spectra Energy) in 2017 until January 1, 2023. Prior to that time, he served as Chairman, President and CEO of Spectra Energy from 2009 until February 27, 2017. Previously, Mr. Ebel also served as Spectra Energy's Group Executive and Chief Financial Officer beginning in 2007, President of Union Gas Limited from 2005 until 2007, and Vice President, Investor & Shareholder Relations of Duke Energy Corporation from 2002 until 2005.

Vern D. Yu was appointed Executive Vice President, Corporate Development, Chief Financial Officer & President, New Energy Technologies on January 1, 2023. Prior thereto, he served as Executive Vice President, Corporate Development and Chief Financial Officer from March 2022 to December 2022, and Executive Vice President and Chief Financial Officer from October 2021 to March 2022. Mr. Yu has oversight for all of Enbridge's financial affairs including investor relations, financial reporting, financial planning, treasury, tax, insurance, risk and audit management functions. He is also responsible for overseeing Enbridge's new energy technology ventures. Previously, Mr. Yu served as Executive Vice President and President, Liquids Pipelines from January 2020 to October 2021; President and Chief Operating Officer for Liquids Pipelines from June 2019 to December 2019; and Executive Vice President and Chief Development Officer from May 2016 to June 2019.

Colin K. Gruending was appointed Executive Vice President and President, Liquids Pipelines on October 1, 2021. Mr. Gruending is responsible for the overall leadership and operations of Enbridge's Liquids Pipelines business. Previously, he served as our Executive Vice President and Chief Financial Officer from June 2019 to October 2021; Senior Vice President, Corporate Development and Investment Review from May 2018 to June 2019; and Vice President, Corporate Development and Investment Review from February 2017 to May 2018.

Cynthia L. Hansen was appointed Executive Vice President and President, Gas Transmission and Midstream on March 1, 2022. Ms. Hansen is responsible for the overall leadership and operations of Enbridge's natural gas pipeline and midstream business across North America. Previously, she served as our Executive Vice President, Gas Distribution and Storage from June 2019 to March 2022 and as Executive Vice President, Utilities and Power Operations from February 2017 to June 2019. Ms. Hansen is also the Executive Sponsor for Asset and Work Management Transformation across Enbridge, working with other business unit leaders.

Byron C. Neiles was appointed Executive Vice President & Chief Administrative Officer on January 1, 2023. Prior thereto, he served as Executive Vice President, Corporate Services from May 2016 to December 2022. Mr. Neiles has oversight of our information technology, human resources, real estate, supply chain management, and public affairs, communications and sustainability functions.

Robert R. Rooney was appointed Executive Vice President and Chief Legal Officer on February 1, 2017. Mr. Rooney leads our legal, ethics and compliance, security and aviation teams across the organization.

Matthew A. Akman was appointed Senior Vice President, Corporate Strategy & President, Power on January 1, 2023. Prior thereto, he was Senior Vice President, Strategy, Power & New Energy Technologies from October 2021 to December 2022, and Senior Vice President, Strategy & Power from June 2019 to October 2021. Mr. Akman is responsible for the overall leadership and operations of Enbridge's power business and also leads our corporate strategy efforts. Mr. Akman joined Enbridge in early 2016 as our head of Corporate Strategy and also previously held responsibilities for Corporate Development and Investor Relations.

Michele E. Harradence was appointed Senior Vice President & President, Gas Distribution and Storage on March 1, 2022. She is responsible for the overall leadership and operations of Ontario-based Enbridge Gas Inc., as well as Gazifère, which serves the Gatineau region of Québec. Prior to assuming her current role, Ms. Harradence was Senior Vice President and Chief Operations Officer of Enbridge's Gas Transmission and Midstream business unit from June 2019 to March 2022. Prior thereto, she was Senior Vice President Operations, Gas Transmission and Midstream from February 2017 to June 2019.

Laura J. Sayavedra was appointed Senior Vice President, Safety & Reliability, Projects and Unify on March 1, 2022. This includes oversight of our safety, capital project execution, environment, land, and right of way functions, and business leadership of our multi-year Unify transformation project. Prior to that, she led Finance Transformation at Enbridge, and was also Vice President & Treasurer for Spectra Energy, and CFO of Spectra Energy Partners. She has held various finance, strategy, and business development executive leadership roles.

ADDITIONAL INFORMATION

Additional information about us is available on our website at www.enbridge.com, on SEDAR at www.sedar.com and on EDGAR at www.sec.gov. The aforementioned information is made available in accordance with legal requirements and is not, unless otherwise specifically stated, incorporated by reference into this Annual Report on Form 10-K. We make available free of charge, through our website, annual reports on Form 10-K, quarterly reports on Form 10-Q and current reports on Form 8-K and amendments to those reports filed or furnished pursuant to Section 13(a) or 15(d) of the Exchange Act, as well as proxy statements, as soon as reasonably practicable after we electronically file such material with, or furnish it to, the SEC. Reports, proxy statements and other information filed with the SEC may also be obtained through the SEC's website (www.sec.gov).

ENBRIDGE GAS INC.

Additional information about Enbridge Gas can be found in its annual information form, financial statements and MD&A for the year ended December 31, 2022, which have been filed with the securities commissions or similar authorities in each of the provinces of Canada. These documents contain detailed disclosure with respect to Enbridge Gas and are publicly available on SEDAR at www.sedar.com. These documents are not, unless otherwise specifically stated, incorporated by reference into this Annual Report on Form 10-K.

ENBRIDGE PIPELINES INC.

Additional information about Enbridge Pipelines Inc. (EPI) can be found in its annual information form, financial statements and MD&A for the year ended December 31, 2022, which have been filed with the securities commissions or similar authorities in each of the provinces of Canada. These documents contain detailed disclosure with respect to EPI and are publicly available on SEDAR at www.sedar.com. These documents are not, unless otherwise specifically stated, incorporated by reference into this Annual Report on Form 10-K.

WESTCOAST ENERGY INC.

Additional information about Westcoast can be found in its financial statements and MD&A for the year ended December 31, 2022, which have been filed with the securities commissions or similar authorities in each of the provinces of Canada. These documents contain detailed disclosure with respect to Westcoast and are publicly available on SEDAR at www.sedar.com. These documents are not, unless otherwise specifically stated, incorporated by reference into this Annual Report on Form 10-K.

ITEM 1A. RISK FACTORS

The following risk factors could materially and adversely affect our business, operations, financial results, market price or value of our securities. This list is not exhaustive, and we place no priority or likelihood based on order of presentation or grouping under sub-captions.

RISKS RELATED TO CLIMATE CHANGE

Climate change risks could adversely affect our business, operations and financial results, and these effects could be material.

Climate change is a systemic risk that presents both physical and transition risks to our organization. A summary of these risks is discussed below. Given the interconnected nature of climate impacts, we also discuss these risks within the context of other risks impacting Enbridge throughout *Item 1A. Risk Factors*.

Climate change and its associated impacts may increase our exposure to, and magnitude of, other risks identified in *Item 1A. Risk Factors*. Our business, financial condition, results of operations, cash flows, reputation, access to and cost of capital or insurance, business plans or strategy may all be materially adversely impacted as a result of climate change and its associated impacts.

PHYSICAL RISKS

Climate-related physical risks as a result of changing and more extreme weather, can damage our assets and affect the safety and reliability of our operations and has had such impacts in the past. Climate-related physical risks may be acute or chronic. Acute physical risks are those that are event-driven, including increased frequency and severity of extreme weather events, such as heavy snowfall, heavy rainfall, floods, landslides, fires, hurricanes, cyclones, tornados, tropical storms, ice storms, and extreme temperatures. Chronic physical risks are longer-term shifts in climate patterns, such as long-term changes in precipitation patterns, or sustained higher temperatures, which may cause sea level rises or chronic heat waves.

Our assets are exposed to potential damage or other negative impacts from these kinds of events, which could result in reduced revenue from business disruption or reduced capacity and may also lead to increased costs due to repairs and required adaptation measures. Such events may also result in loss of life or injury or damage to property and the environment. We have experienced operational interruptions and damage to our assets from such weather events in the past, and we expect to experience climate-related physical risks in the future, potentially with increasing frequency or severity.

TRANSITION RISKS

Transition risks relate to the transition to a lower-emissions economy, which may increase our cost of operations, impact our business plans, and influence stakeholder decisions about our company, each of which could adversely impact our reputation, strategic plan, business, operations or financial results. These transition risks include:

- ***Policy and legal risks***
  Foreign and domestic governments continue to evaluate and implement policy, legislation, and regulations regarding reduction of GHG emissions, adaptation to climate change, transition to a lower-carbon economy, and disclosure of climate-related matters. Such policies, laws and regulations vary at the federal, state, provincial and municipal levels in which Enbridge operates and are continually evolving. International multilateral agreements, the obligations adopted thereunder, increasing physical impacts of climate change, changing political and public opinion and legal challenges concerning the adequacy of climate-related policy brought against governments and corporations, among other factors, are expected to accelerate the implementation of these measures. Efforts to regulate or restrict GHG emissions could negatively impact demand for the products we transport. Significant expenditures and resources could be required in order to meet new regulatory requirements. In addition, there has been an increase in climate and disclosure-related litigation against governments as well as energy companies. There is no assurance that our company will not be impacted by such litigation.

  In addition, Enbridge is required to adhere to a number of implicit and explicit carbon-pricing mechanisms. Many jurisdictions in which we operate are either increasing the stringency of existing, or introducing new, legislation or public policy to address climate change and reduce GHG emissions. These mechanisms may present climate-related transition risk to our business strategy, impacting both commodity demand and the overall energy mix we deliver. Carbon pricing mechanisms may expose us to increased costs as well as increasing energy costs to our customers. Our operations are subject to both explicit carbon prices (i.e., in BC) and implicit carbon prices (i.e., Canadian federal OBPS). These requirements are evolving; in Canada, the federal government is considering options to cap and cut oil and gas sector GHG emissions, which may impact our business, including a new cap-and-trade system under the *Canadian Environmental Protection Act, 1999* or modification of the current carbon pricing approach under the *Greenhouse Gas Pollution Pricing Act*.

- ***Technology risks***
  Our success in executing our strategic plan, including adapting to the energy transition over time and attaining our GHG emissions reduction goals and targets, depends, in part, on technology (including technology still under development), innovation and continued diversification with renewable power and other lower-carbon energy infrastructure as well as modernization of our infrastructure to reduce GHG emissions. Achieving our GHG emissions reduction goals and targets could require significant capital expenditures and resources, with the potential that the costs required to achieve our goals and targets materially differ from our original estimates and expectations. Similarly, there is a risk that emissions reduction technology does not materialize as expected, making it more difficult to reduce emissions.

- ***Market risks***
  Climate change concerns, increase in demand for lower-carbon and zero-emissions energy, alternative and new energy sources and technologies, changing customer behavior and reduced energy consumption could impact the demand for our services or securities. The pace and scale of the transition to a lower-carbon economy may pose a risk if Enbridge diversifies either too quickly or too slowly. Similarly, uncertainty in market signals, such as abrupt and unexpected shifts in energy costs and demands, including due to climate change concerns, can impact revenue through reduced throughput volumes on our pipeline transportation systems.

- ***Reputational risks***
  We have long been committed to strong ESG practices and performance, and in November 2020, we introduced a set of ESG goals to strengthen transparency and accountability. We have set GHG emissions reduction goals and one of our strategic priorities is to adapt to the energy transition over time. If we are not able to achieve our GHG emissions reduction goals, are not able to meet future climate, emissions or other reporting requirements of regulators, or are not able to meet or manage current and future expectations and issues important to investors or other stakeholders, including those related to climate change, it could negatively impact our reputation and our business, operations or financial results.

- ***Disclosure risks***
  Finally, we currently provide certain climate-related disclosures, and from time to time, we establish and publicly announce goals and commitments to reduce our GHG emissions. These disclosures and goals, and our progress towards these commitments, may be based on standards for measuring progress that are still developing, internal controls and processes that continue to evolve, and assumptions that are subject to change in the future. There can be no assurance that our current or future disclosures and goals, the pathways by which we plan to reach our goals, or the methodologies that we currently use to support our disclosures and progress towards our goals, will satisfy any new and evolving regulations and legal requirements or expectations of our stakeholders, and the costs of aligning our current disclosures and goals to any new legal requirements may be significant. Additionally, if we fail to achieve or improperly report on our progress toward achieving our emissions reduction goals and commitments, we may be subject to reputational harm, regulatory action, or other legal action.

Companies across all sectors and industries are facing changing expectations or increasing scrutiny from stakeholders related to their approach to ESG matters, including climate change and GHG emissions. Companies in the energy industry are experiencing stakeholder opposition to new infrastructure, as well as organized opposition to oil and natural gas extraction and shipment of oil and natural gas products.

Our business is undergoing significant changes driven by technological advancements and the energy transition, which could impact our strategic plan, business, operations or financial results.
Our success in executing our strategic plan, including adapting to the energy transition over time and attaining our GHG emissions reduction goals and targets depends, in part, on technology (including technology still under development), innovation and continued diversification with renewable power and other lower-carbon energy infrastructure, as well as modernization of our infrastructure to reduce GHG emissions, all of which could require significant capital expenditures and resources. Public policy relating to climate change can drive investment in lower-emissions technologies which could impact both the supply of and demand for crude oil and other liquid hydrocarbons transported on our pipelines.

RISKS RELATED TO OPERATIONAL DISRUPTION OR CATASTROPHIC EVENTS

Operation of complex energy infrastructure involves many hazards and risks that may adversely affect our business, financial results and the environment.
These operational risks include adverse weather conditions, natural disasters, accidents, the breakdown or failure of equipment or processes, and lower than expected levels of operating capacity and efficiency. These operational risks could be catastrophic in nature.

Operational risk is also intensified by climate change. Climate change presents physical risks that may affect the safety and reliability of our operations. These include acute physical risks, such as heavy snowfall, heavy rainfall, floods, landslides, fires, hurricanes, cyclones, tornados, tropical storms, ice storms, and extreme temperatures, and chronic physical risks, such as long-term changes in precipitation patterns, or sustained higher temperatures.

Our assets and operations are exposed to potential damage or other negative impacts from these operational risks, which could result in reduced revenue from business disruption or reduced capacity and may also lead to increased costs due to repairs and required adaptation measures. Such events have led to, could in the future lead to, rupture or release of product from our pipeline systems and facilities, or loss of life or injury to people, which could result in substantial losses for which insurance may not be sufficient or available and for which we may bear part or all of the cost.

An environmental incident is an event that may cause environmental harm and could lead to increased operating and insurance costs, thereby negatively impacting earnings. An environmental incident could have lasting reputational impacts and could impact our ability to work with various stakeholders. For pipeline and storage assets located near populated areas, including residential communities, commercial business centers, industrial sites and other public gathering locations, the level of damage resulting from these events could be greater.

We have experienced such events in the past, including in 2010 on Lines 6A and 6B of the Lakehead System; in October 2018 at the BC Pipeline T-South system; in January 2019, August 2019 and May 2020 at the Texas Eastern Pipeline; impacts from the winter storm in February 2021 in Texas; and from wildfires in July 2021 and flooding in November 2021 in BC. We have incurred and expect to continue to incur significant costs in preparing for or responding to operational risks and events. We expect to continue to experience climate-related physical risks, potentially with increasing frequency and severity, and we cannot guarantee that we will not experience catastrophic or other events in the future. In addition, we could be subject to litigation and significant fines and penalties from regulators in connection with any such events.

A service interruption could have a significant impact on our operations, and negatively impact financial results, relationships with stakeholders and our reputation.
A service interruption due to a major power disruption, curtailment of commodity supply, operational incident, security incident (cyber or physical), availability of gas supply or distribution or other reasons could have a significant impact on our operations and negatively impact financial results, relationships with stakeholders, our reputation or the safety of our end customers. Service interruptions that impact our crude oil and natural gas transportation services can negatively impact shippers' operations and earnings as they are dependent on our services to move their product to market or fulfill their own contractual arrangements, and this has in the past and may again lead to claims against us. We have experienced, and may again experience, service interruptions, restrictions or other operational constraints, including in connection with the kinds of operational incidents referred to in the previous risk factor.

Our operations involve safety risks to the public and to our workers and contractors.
Several of our pipelines and distribution systems are operated in close proximity to populated areas and a major incident could result in injury or loss of life to members of the public. In addition, given the natural hazards inherent in our operations, our workers and contractors are subject to personal safety risks. A public safety incident or an injury or loss of life to our workers or contractors, which we have experienced in the past and, despite the precautions we take, may experience in the future, could result in reputational damage to us, material repair costs or increased operating and insurance costs.

Cyber attacks pose threats to our technology systems and could materially adversely affect our business, operations, reputation or financial results.
Our business is dependent upon information systems and other digital technologies for controlling our plants, pipelines and other assets, processing transactions and summarizing and reporting results of operations. The secure processing, maintenance and transmission of information is critical to our operations. A security breach of our network or systems, or the network or systems of our third-party vendors, could result in improper operation of our assets, potentially including delays in the delivery or availability of our customers' products, contamination or degradation of the products we transport, store and distribute, damage to our facilities or those of our customers, or releases of hydrocarbon products for which we could be held liable, all of which could materially adversely affect our reputation, business, operations or financial results. Furthermore, we and some of our vendors collect and store sensitive data in the ordinary course of our business, including personal information of our employees and residential gas distribution customers as well as our proprietary business information and that of our customers, suppliers, investors and other stakeholders.

Cybersecurity risks have increased in recent years as a result of the proliferation of new technologies and the increased sophistication of cyber attacks and data security breaches, as well as due to international and domestic political factors including geopolitical tensions, armed hostilities, war, civil unrest, sabotage and terrorism. Human error can also contribute to a cyber incident, and cyber attacks can be internal as well as external and occur at any point in our supply chain. Because of the critical nature of our infrastructure and our use of information systems and other digital technologies to control our assets, we face a heightened risk of cyber attacks. Cyber threat actors have attacked and threatened to attack energy infrastructure, and various government agencies have increasingly stressed that these attacks are targeting critical infrastructure, and are increasing in sophistication, magnitude, and frequency. New cybersecurity legislation, regulations and orders have been recently implemented or proposed resulting in additional actual and anticipated regulatory oversight and compliance requirements, which will require significant internal and external resources. We cannot predict the potential impact to our business of potential future legislation, regulations or orders relating to cybersecurity.

We have been, and expect to continue to be, the target of cyber-attacks against which we have deployed, and continue to deploy, security measures. Our information systems or those of our vendors or other service providers are expected to become the target of further cyber attacks or security breaches which could compromise our data and systems, affect our ability to correctly record, process and report transactions, result in the loss of information, or cause operational disruption or incidents. As a result of a cyber attack or security breach, we could also be liable under laws that protect the privacy of personal information, be subject to regulatory action, fines or penalties, incur additional costs for remediation, litigation, breach of contract or indemnity claims, or other costs, all of which could materially adversely affect our reputation, business, operations or financial results.

In addition, a cyber attack could occur and persist for an extended period without detection. Any investigation of a cyber attack or other security incident may be inherently unpredictable, and it would take time before the completion of any investigation and availability of full and reliable information. During such time, we may not know the extent of the harm or how best to remediate it, and certain errors or actions could be repeated or compounded before they are discovered and remediated, all or any of which could further increase the costs and consequences of a cyber attack or other security incident, and our remediation efforts may not be successful. The inability to implement, maintain and upgrade adequate safeguards could materially and adversely affect our results of operations, cash flows, and financial condition. As cyber attacks continue to evolve, we may be required to expend significant additional resources to continue to modify or enhance our protective measures or to investigate and remediate any information security vulnerabilities.

Furthermore, media reports about a cyber attack or other significant security incident affecting the Company, whether accurate or not, or, under certain circumstances, our failure to make adequate or timely disclosures to the public, law enforcement, other regulatory agencies or affected individuals following any such event, whether due to delayed discovery or otherwise, could negatively impact our operating results and result in other negative consequences, including damage to our reputation or competitiveness, harm to our relationships with customers, partners, suppliers and other third parties, interruption to our management, remediation or increased protection costs, significant litigation or regulatory action, fines or penalties, all of which could materially adversely affect our business, operations, reputation or financial results.

Pandemics, epidemics or infectious disease outbreaks, such as the COVID-19 pandemic, may adversely affect local and global economies and our business, operations or financial results.
Disruptions caused by pandemics, epidemics or infectious disease outbreaks could materially adversely affect our business, operations, financial results and forward-looking expectations. Governments' emergency measures to combat the spread could include restrictions on business activity and travel, as well as requirements to isolate or quarantine. The duration and magnitude of such impacts will depend on many factors that we may not be able to accurately predict. COVID-19 and government responses interrupted business activities and supply chains, disrupted travel, and contributed to significant volatility in the financial and commodity markets.

Disruptions related to pandemics, epidemics or infectious disease outbreaks could have the effect of heightening many of the other risks described in this *Item 1A. Risk Factors*.

Terrorist attacks and threats, escalation of military activity in response to these attacks or acts of war, and other civil unrest or activism could adversely affect our business, operations or financial results.
Terrorist attacks and threats (which may take the form of cyber attacks), escalation of military activity, armed hostilities, war, sabotage, or civil unrest or activism may have significant effects on general economic conditions and may cause fluctuations in consumer confidence and spending and market liquidity, each of which could adversely affect our business. Future terrorist attacks, rumors or threats of war, actual conflicts involving the US or Canada, or military or trade disruptions may significantly affect our operations and those of our customers. Strategic critical infrastructure targets, such as energy-related assets, are at greater risk of cyber attack and may be at greater risk of other future attacks than other targets in the US and Canada. The Company’s infrastructure and projects under construction could be direct targets or indirect casualties of a cyber or physical attack. In addition, increased environmental activism against pipeline construction and operation could potentially result in work delays, reduced demand for our products and services, new legislation or public policy or increased stringency thereof, or denial or delay of permits and rights-of-way.

RISKS RELATED TO OUR BUSINESS AND INDUSTRY

There are utilization risks with respect to our assets.
With respect to our Liquids Pipelines assets, we may be exposed to throughput risk on the Canadian Mainline depending upon the tolling framework we adopt for that system, and we are exposed to throughput risk under certain tolling agreements applicable to other Liquids Pipelines assets, such as the Lakehead System. A decrease in volumes transported can directly and adversely affect our revenues and earnings. Factors such as changing market fundamentals, capacity bottlenecks, regulatory restrictions, maintenance and operational incidents on our system and upstream or downstream facilities, and increased competition can all impact the utilization of our assets. Market fundamentals, such as commodity prices and price differentials, weather, gasoline price and consumption, alternative and new energy sources and technologies, and global supply disruptions outside of our control can impact both the supply of and demand for crude oil and other liquid hydrocarbons transported on our pipelines.

With respect to our Gas Transmission and Midstream assets, gas supply and demand dynamics continue to change due to shifts in regional and global production and consumption. These shifts can lead to fluctuations in commodity prices and price differentials, resulting in oversupply of pipeline takeaway capacity in some areas and an adverse effect to the utilization of our systems. Other factors affecting system utilization include operational incidents, regulatory restrictions, system maintenance, and increased competition.

With respect to our Gas Distribution and Storage assets, customers are billed on both a fixed charge and volumetric basis and our ability to collect the total revenue requirement (the cost of providing service, including a reasonable return to the utility) depends on achieving the forecast distribution volume established in the rate-making process. The probability of realizing such volume is contingent upon four key forecast variables: weather, economic conditions, pricing of competitive energy sources and growth in the number of customers. Weather is a significant driver of delivery volumes, given that a significant portion of our Gas Distribution customer base uses natural gas for space heating. Distribution volume may also be impacted by the increased adoption of energy efficient technologies, along with more efficient building construction, that continue to place downward pressure on consumption. In addition, conservation efforts by customers may further contribute to a decline in annual average consumption. Sales and transportation service to large volume commercial and industrial customers is more susceptible to prevailing economic conditions. As well, the pricing of competitive energy sources affects volume distributed to these sectors as some customers have the ability to switch to an alternate fuel. Even in those circumstances where we attain our respective total forecast distribution volume, our Gas Distribution business may not earn its expected ROE due to other forecast variables, such as the mix between the higher margin residential and commercial sectors and the lower margin industrial sector. Our Gas Distribution business remains at risk for the actual versus forecast large volume contract commercial and industrial volumes.

With respect to our Renewable Power Generation assets, earnings from these assets are highly dependent on weather and atmospheric conditions as well as continued operational availability of these energy producing assets. While the expected energy yields for Renewable Power Generation projects are predicted using long-term historical data, wind and solar resources are subject to natural variation from year-to-year and from season-to-season. Any prolonged reduction in wind or solar resources at any of the Renewable Power Generation facilities could lead to decreased earnings and cash flows. Additionally, inefficiencies or interruptions of Renewable Power Generation facilities due to operational disturbances or outages resulting from weather conditions or other factors, could also impact earnings.

Our assets vary in age and were constructed over many decades which causes our inspection, maintenance or repair costs to increase.

Our pipelines vary in age and were constructed over many decades. Pipelines are generally long-lived assets, and pipeline construction and coating techniques have changed over time. Depending on the era of construction and construction techniques, some assets require more frequent inspections, which has resulted in and is expected to continue to result in increased maintenance or repair expenditures in the future. Any significant increase in these expenditures could adversely affect our business, operations or financial results.

Competition may result in a reduction in demand for our services, fewer project opportunities or assumption of risk that results in weaker or more volatile financial performance than expected.
Our Liquids Pipelines business faces competition from competing carriers available to ship liquid hydrocarbons to markets in Canada, the US and internationally and from proposed pipelines that seek to access basins and markets currently served by our Liquids Pipelines. Competition among existing pipelines is based primarily on the cost of transportation, access to supply, the quality and reliability of service, contract carrier alternatives and proximity to markets. The liquids transported in our pipelines currently, or are expected to increasingly, compete with other emerging alternatives for end-users, including, but not limited to, electric batteries, biofuels, and hydrogen. Additionally, we face competition from alternative storage facilities. Our natural gas transmission and storage businesses compete with similar facilities that serve our supply and market areas in the transmission and storage of natural gas. The natural gas transported in our business also competes with other forms of energy available to our customers and end-users, including electricity, coal, propane, fuel oils, and renewable energy. Our Renewable Power Generation business faces competition in the procurement of long-term power purchase agreements and from other fuel sources in the markets in which we operate. Competition in all of our businesses, including competition for new project development opportunities, could have a negative impact on our business, financial condition or results of operations.

Completion of our secured projects and maintenance programs are subject to various regulatory, operational and market risks, which may affect our ability to drive long-term growth.
Our project execution continues to face challenges with intense scrutiny on regulatory and environmental permit applications, politicized permitting, public opposition including protests, action to repeal permits, and resistance to land access.

Continued challenges with global supply chains have created unpredictability in materials cost and availability. Labor shortages and union strikes have increased costs of engineering and construction services.

Other events that can and have delayed project completion and increased anticipated costs include contractor or supplier non-performance, extreme weather events or geological factors beyond our control.

Changing expectations of stakeholders regarding ESG practices and climate change could erode stakeholder trust and confidence, damage our reputation and influence actions or decisions about our company and industry and have negative impacts on our business, operations or financial results.
Companies across all sectors and industries are facing changing expectations or increasing scrutiny from stakeholders related to their approach to ESG matters of greatest relevance to their business and to their stakeholders. For energy companies, climate change, GHG emissions, safety and stakeholder and Indigenous relations remain primary focus areas, while other environmental elements such as biodiversity and supply chain are ascendant. Companies in the energy industry are experiencing stakeholder opposition to new and existing infrastructure, as well as organized opposition to oil and natural gas extraction and shipment of oil and natural gas products. Changing expectations of our practices and performance across these ESG areas may impose additional costs or create exposure to new or additional risks. We are also exposed to the risk of higher costs, delays, project cancellations, loss of ability to secure new growth opportunities, new restrictions or the cessation of operations of existing pipelines due to increasing pressure on governments and regulators, and legal action, such as the legal challenges to the operation of Line 5 in Michigan and Wisconsin.

Our operations, projects and growth opportunities require us to have strong relationships with key stakeholders, including local communities, Indigenous groups and others directly impacted by our activities, as well as governments, regulatory agencies, investors and investor advocacy groups, investment funds, financial institutions, insurers and others, which are increasingly focused on ESG practices and performance.

Enhanced public awareness of climate change has driven an increase in demand for lower-carbon and zero-emissions energy. Over the past year, the invasion of Ukraine and inflationary pressure following the COVID-19 pandemic have underscored the critical need for access to secure affordable energy. Enbridge has a long history of diversifying its portfolio of businesses to align with the mix of energy that people need and want. The pace and scale of the transition to a lower-emission economy may pose a risk if Enbridge diversifies either too quickly or too slowly. Similarly, unexpected shifts in energy demands, including due to climate change concerns, can impact revenue through reduced throughput volumes on our pipeline transportation systems.

We have long been committed to strong ESG practices, performance and reporting, and in 2020 introduced a set of ESG goals to strengthen transparency and accountability. The goals include increasing diversity and inclusion within our organization and reducing GHG emissions from our operations to net-zero by 2050, with corporate and business unit action plans aligned to our strategic priority to adapt to the energy transition over time. The costs associated with meeting our ESG goals, including our GHG emissions reduction goals, could be significant. There is also a risk that some or all of the expected benefits and opportunities of achieving our ESG goals may fail to materialize, may cost more than anticipated to achieve, may not occur within the anticipated time periods or may no longer meet changing stakeholder expectations. Similarly, there is a risk that emissions reduction technologies do not materialize as expected making it more difficult to reduce emissions. If we are not able to achieve our ESG goals, are not able to meet current and future climate, emissions or related reporting requirements of regulators, or are unable to meet or manage current and future expectations regarding issues important to investors or other stakeholders (including those related to climate change), it could erode stakeholder trust and confidence, which could negatively impact our reputation, business, operations or financial results. Potential impacts could also include changing investor sentiment regarding investment in Enbridge or impair our access to and increase our cost of capital, including penalties associated with our sustainability-linked financing.

Our forecasted assumptions may not materialize as expected, including on our expansion projects, acquisitions and divestitures.
We evaluate expansion projects, acquisitions and divestitures on an ongoing basis. Planning and investment analysis is highly dependent on accurate forecasting assumptions and to the extent that these assumptions do not materialize, financial performance may be lower or more volatile than expected. Volatility and unpredictability in the economy, both locally and globally, and changes in cost estimates, project scoping and risk assessment could result in a loss of profits. Similarly, uncertainty in market signals, such as abrupt and unexpected shifts in energy costs and demands, as we saw in 2020 resulting from the COVID-19 pandemic, have impacted, and may in the future impact, revenue through reduced throughput volumes on our pipeline transportation systems.

Our insurance coverage may not fully cover our losses in the event of an accident, natural disaster or other hazardous event, and we may encounter increased cost arising from the maintenance of, or lack of availability of, insurance.
Our operations are subject to many hazards inherent in our industry. Our assets may experience physical damage as a result of an accident or natural disaster. These hazards can also cause, and in some cases have caused, personal injury and loss of life, severe damage to and destruction of property and equipment, pollution or environmental damage, and suspension of operations.

We maintain an insurance program for us, our subsidiaries and certain of our affiliates to mitigate a certain portion of our risks. However, not all potential risks arising from our operations are insurable, or are insured by us as a result of availability, high premiums and for various other reasons. The Company self-insures a significant portion of certain risks through our wholly-owned captive insurance subsidiaries, and the Company’s insurance coverage is subject to terms and conditions, exclusions and large deductibles or self-insured retentions which may reduce or eliminate coverage in certain circumstances.

The Company's insurance policies are generally renewed on an annual basis and, depending on factors such as market conditions, the premiums, terms, policy limits and/or deductibles can vary substantially. We can give no assurance that we will be able to maintain adequate insurance in the future at rates or on other terms we consider commercially reasonable. In such case, we may decide to self-insure additional risks.

A significant self-insured loss, uninsured loss, a loss significantly exceeding the limits of our insurance policies, a significant delay in the payment of a major insurance claim, or the failure to renew insurance policies on similar or favorable terms could materially and adversely affect our business, financial condition and results of operations.

We are exposed to the credit risk of our customers, counterparties, and vendors.
We are exposed to the credit risk of multiple parties in the ordinary course of our business. Generally, our customers are rated investment-grade, are otherwise considered creditworthy or provide us security to satisfy credit concerns. However, we cannot predict to what extent our business would be impacted by deteriorating conditions in the economy, including possible declines in the creditworthiness of our customers, vendors, or counterparties. It is possible that payment or performance defaults from these entities, if significant, could adversely affect our earnings and cash flows.

Our business is exposed to changes in market prices including interest rates and foreign exchange rates. Our risk management policies cannot eliminate all risks and may result in material financial losses. In addition, any non-compliance with our risk management policies could adversely affect our business, operations or financial results.
Our use of debt financing exposes us to changes in interest rates on both future fixed rate debt issuances and floating rate debt. While our financial results are denominated in Canadian dollars, many of our businesses have foreign currency revenues or expenses, particularly the US dollar. Changes in interest rates and foreign exchange rates could materially impact our financial results.

We use financial derivatives to manage risks associated with changes in foreign exchange rates, interest rates, commodity prices, power prices and our share price to reduce volatility of our cash flows. Based on our risk management policies, substantially all of our financial derivatives are associated with an underlying asset, liability and/or forecasted transaction and not intended for speculative purposes.

These policies cannot, however, eliminate all risk, including unauthorized trading. Although this activity is monitored independently by our Risk Management function, we can provide no assurance that we will detect and prevent all unauthorized trading and other violations, particularly if deception, collusion or other intentional misconduct is involved, and any such violations could adversely affect our business, operations or financial results.

In addition, to the extent that we hedge our foreign exchange rates, interest rates or commodity prices, we will forego the benefits we would otherwise experience if these were to change in our favor. In addition, hedging activities can result in losses that might be material to our financial condition, results of operations and cash flows. Such losses have occurred in the past and could occur in the future. See Part II, *Item 7A. Quantitative and Qualitative Disclosures about Market Risk* and *Item 8. Financial Statements and Supplementary Data* for a discussion of our derivative instruments and related hedging activities.

Our business requires the retention and recruitment of a skilled and diverse workforce, and difficulties in recruiting and retaining our workforce could result in a failure to implement our business plans.
Our operations and management require the retention and recruitment of a skilled and diverse workforce, including engineers, technical personnel, other professionals and executive officers and senior management. We and our affiliates compete with other companies in the energy industry, and for some jobs the broader labor market, for this skilled workforce. If we are unable to retain current employees and/or recruit new employees of comparable knowledge and experience, our business could be negatively impacted. In addition, we could experience increased costs to retain and recruit these professionals.

Our Liquids Pipelines growth rate and results may be directly and indirectly affected by commodity prices and government policy.
Effective December 31, 2021, the Government of Alberta lifted the oil production curtailment that was imposed in December 2018. Wide commodity price basis between Western Canada and global tidewater markets have negatively impacted producer netbacks and margins in the past years that largely resulted from pipeline infrastructure takeaway capacity from producing regions in Western Canada and North Dakota which are operating at capacity. A protracted long-term outlook for low crude oil prices could result in delay or cancellation of future projects.

The tight conventional oil plays of Western Canada, the Permian basin, and the Bakken region of North Dakota have short cycle break-even time horizons, typically less than 24 months, and high decline rates that can be well managed through active hedging programs and are positioned to react quickly to market signals. Accordingly, during periods of comparatively low prices, drilling programs, unsupported by hedging programs, will be reduced and as such, supply growth from tight oil basins may be lower, which may impact volumes on our pipeline systems.

Our Energy Services and Gas Transmission and Midstream results may be adversely affected by commodity price volatility.
Within our US Midstream assets, through our investments in DCP and Aux Sable, we are engaged in the businesses of gathering, treating and processing natural gas and natural gas liquids. The financial results of these businesses are directly impacted by changes in commodity prices. To a lesser degree, the financial results of our US Transmission business are subject to fluctuation in power prices which impact electric power costs associated with operating compressor stations.

Energy Services generates margin by capitalizing on quality, time and location differentials when opportunities arise. Changing market conditions that impact the prices at which we buy and sell commodities have in the past limited margin opportunities and impeded Energy Services' ability to cover capacity commitments and could do so again in the future. Other market conditions, such as backwardation, have likewise limited margin opportunities.

We rely on access to short-term and long-term capital markets to finance capital requirements and support liquidity needs. Cost effective access to those markets can be affected, particularly if we or our rated subsidiaries are unable to maintain an investment-grade credit rating.
A significant portion of our consolidated asset base is financed with debt. The maturity and repayment profile of debt used to finance investments often does not correlate to cash flows from assets. Accordingly, we rely on access to both short-term and long-term capital markets as a source of liquidity for capital requirements not satisfied by cash flows from operations and to refinance investments originally financed with debt. Our senior unsecured long-term debt is currently rated investment-grade by various rating agencies. If the rating agencies were to rate us or our rated subsidiaries below investment-grade, our borrowing costs would increase, perhaps significantly. Consequently, we would likely be required to pay a higher interest rate in future financings and our potential pool of investors and funding sources could decrease.

We maintain revolving credit facilities at various entities to backstop commercial paper programs, for borrowings and for providing letters of credit. These facilities typically include financial covenants and failure to maintain these covenants at a particular entity could preclude that entity from accessing the credit facility, which could impact liquidity. Furthermore, if our short-term debt rating were to be downgraded, access to the commercial paper market could be significantly limited. Although this would not affect our ability to draw under our credit facilities, borrowing costs could be significantly higher.

Recently, interest rates have increased significantly. If we are not able to access capital at competitive rates or at all, our ability to finance operations and implement our strategy may be affected. An inability to access capital on favorable terms or at all may limit our ability to pursue enhancements or acquisitions that we may otherwise rely on for future growth or to refinance our existing indebtedness. Any downgrade or other event negatively affecting the credit ratings of our subsidiaries could make their costs of borrowing higher or access to funding sources more limited, which in turn could increase our need to provide liquidity in the form of capital contributions or loans to such subsidiaries, thus reducing the liquidity and borrowing availability of the consolidated group.

RISKS RELATED TO GOVERNMENT REGULATION AND LEGAL RISKS

Many of our operations are regulated and failure to secure timely regulatory approval for our proposed projects, or loss of required approvals for our existing operations, could have a negative impact on our business, operations or financial results.
The nature and degree of regulation and legislation affecting permitting and environmental review for energy infrastructure companies in Canada and the US continues to evolve.

Within the US and in Canada, pipeline companies continue to face opposition from anti-energy/anti-pipeline activists, Indigenous and tribal groups and communities, citizens, environmental groups, and politicians concerned with either the safety of pipelines or their potential environmental effects. In the US, the Environmental Protection Agency redefined the Waters of the United States under Section 401 of the Clean Water Act, and the FERC released draft policy statements on the Certification of New Interstate Natural Gas Facilities and the Consideration of Greenhouse Gas Emissions in Natural Gas Infrastructure Project Review that could introduce changes to the regulatory approval process for natural gas infrastructure. The Council for Environmental Quality published immediately applicable guidance for conducting analyses under the National Environmental Policy Act that may significantly change environmental scope and cost assessments. Many other regulations adopted during the previous US presidential administration are being challenged in multiple courts and some have been overturned by reviewing courts. The current US administration may take further action to modify or reverse regulations that were promulgated by the previous US administration.

In March of 2023, the Supreme Court of Canada will hear the Attorney General of Canada's appeal of the Alberta Court of Appeal's non-binding decision that the federal Impact Assessment Act ("IAA") is unconstitutional. The IAA includes impact assessment requirements that could apply to either federally or provincially regulated pipeline projects that fall within prescribed criteria or that the federal Minister of Environment otherwise designates for review. The potential for any pipeline project to be subject to IAA requirements adds significant uncertainty as to regulatory timelines and outcomes. The Alberta Court of Appeal found that the IAA is an impermissible federal overreach into provincial jurisdiction that would amount to a de facto expropriation of provincial natural resources and proprietary interests by the federal government. The Supreme Court of Canada will determine whether the IAA and the related Physical Activities Regulations are within the constitutional legislative authority of the Parliament of Canada, the outcome of which could impact the applicability of the legislation to provincially regulated pipeline projects.

These actions could adversely impact permitting of a wide range of energy projects. We may not be able to obtain or maintain all required regulatory approvals for our operating assets or development projects. If there is a significant delay in obtaining any required regulatory approvals, if we fail to obtain or comply with them, or if laws or regulations change or are administered in a more stringent manner, the operations of facilities or the development of new facilities could be prevented, delayed or become subject to additional costs.

Our operations are subject to numerous environmental and climate laws and regulations, including those relating to climate change and GHG emissions and climate-related disclosure, compliance with which may require significant capital expenditures, increase our cost of operations, and affect or limit our business plans, or expose us to environmental liabilities.
We are subject to numerous environmental laws and regulations affecting many aspects of our past, current, and future operations, including air emissions, water quality, wastewater discharges, solid waste and hazardous waste.

If we are unable to obtain or maintain all required environmental regulatory approvals and permits for our operating assets and projects or if there is a delay in obtaining any required environmental regulatory approvals or permits, the operation of existing facilities or the development of new facilities could be prevented, delayed, or become subject to additional costs. Failure to comply with environmental laws and regulations may result in the imposition of civil or criminal fines, penalties and injunctive measures affecting our operating assets. We expect that changes in environmental laws and regulations, including those related to climate change and GHG emissions, could result in a material increase in our cost of compliance with such laws and regulations, such as costs to monitor and report our emissions and install new emission controls to reduce emissions. We may not be able to include some or all of such increased costs in the rates charged for utilization of our pipelines or other facilities.

Our operations are subject to operational regulation and other requirements, including compliance with easements and other land tenure documents, and failure to comply with applicable regulations and other requirements could have a negative impact on our reputation, business, operations or financial results.
Operational risks relate to compliance with applicable operational rules and regulations mandated by governments, applicable regulatory authorities, or other requirements that may be found in easements, permits, or other agreements that provide a legal basis for our operations, breaches of which could result in fines, penalties, awards of damages, operating restrictions (including shutdown of lines) and an overall increase in operating and compliance costs.

We do not own all of the land on which our pipelines, facilities and other assets are located and we obtain the rights to construct and operate our pipelines and other assets from third parties or government entities. In addition, some of our pipelines, facilities and other assets cross Indigenous lands pursuant to rights-of-way or other land tenure interests. Our loss of these rights could have an adverse effect on our reputation, operations and financial results. We have experienced litigation in relation to certain Line 5 easements; refer to Part II. *Item 7. Management's Discussion and Analysis of Financial Condition and Results of Operations - Legal and Other Updates*.

Regulatory scrutiny over our assets and operations has the potential to increase operating costs or limit future projects. Regulatory enforcement actions issued by regulators for non-compliant findings can increase operating costs and negatively impact reputation. Potential regulatory changes and legal challenges could have an impact on our future earnings from existing operations and the cost related to the construction of new projects. Regulators' future actions may differ from current expectations, or future legislative changes may impact the regulatory environments in which we operate. While we seek to mitigate operational regulation risk by actively monitoring and consulting on potential regulatory requirement changes with the respective regulators directly, or through industry associations, and by developing response plans to regulatory changes or enforcement actions, such mitigation efforts may be ineffective or insufficient. While we believe the safe and reliable operation of our assets and adherence to existing regulations is the best approach to managing operational regulatory risk, the potential remains for regulators or other government officials to make unilateral decisions that could disrupt our operations or have an adverse financial impact on us.

Our operations are subject to economic regulation and failure to secure regulatory approval for our proposed or existing commercial arrangements could have a negative impact on our business, operations or financial results.
Our Liquids Pipelines, Gas Transmission and Gas Distribution assets face economic regulation risk. Broadly defined, economic regulation risk is the risk that governments or regulatory agencies change or reject proposed or existing commercial arrangements or policies, including permits and regulatory approvals for both new and existing projects or agreements, upon which future and current operations are dependent. Our Mainline System, other liquids pipelines, gas transmission and distribution assets are subject to the actions of various regulators, including the CER, the FERC, and the OEB with respect to the rates, tariffs, and tolls for these assets. The changing or rejecting of commercial arrangements, including decisions by regulators on the applicable permits and tariff structure or changes in interpretations of existing regulations by courts or regulators such as with respect to the Mainline Commercial Framework, could have an adverse effect on our revenues and earnings.

Our Renewable Power Generation assets in Europe (France, Germany and the UK) are also subject to the directives, regulations and policies established and enforced by the EU and the UK government. These measures are variable and can include price controls, caps and demand reduction goals, all of which can have a negative impact on our revenues and earnings.

We are subject to changes in our tax rates, the adoption of new US, Canadian or international tax legislation or exposure to additional tax liabilities.
We are subject to taxes in the US, Canada and numerous foreign jurisdictions. Due to economic and political conditions, tax rates in various jurisdictions may be subject to significant change. Our effective tax rates could be affected by changes in the mix of earnings in countries with differing statutory tax rates, changes in the valuation of deferred tax assets and liabilities, or changes in tax laws or their interpretation. In particular, Canada has introduced interest deductibility rules, the US enacted the Inflation Reduction Act and we are anticipating a minimum tax rate to be introduced on a global basis for OECD countries. All of these measures could cause our effective tax rate to increase.

We are also subject to the examination of our tax returns and other tax matters by the US Internal Revenue Service, the Canada Revenue Agency and other tax authorities and governmental bodies. We regularly assess the likelihood of an adverse outcome resulting from these examinations to determine the adequacy of our provision for taxes. There can be no assurance as to the outcome of these examinations. If our effective tax rates were to increase, particularly in the US or Canada, or if the ultimate determination of our taxes owed is for an amount in excess of amounts previously accrued, our financial condition and operating results could be materially adversely affected.

We are involved in numerous legal proceedings, the outcomes of which are uncertain, and resolutions adverse to us could adversely affect our financial results.
We are subject to numerous legal proceedings. In recent years, there has been an increase in climate and disclosure-related litigation against governments as well as companies involved in the energy industry. There is no assurance that we will not be impacted by such litigation, or by other legal proceedings. Litigation is subject to many uncertainties, and we cannot predict the outcome of individual matters with assurance. It is reasonably possible that the final resolution of some of the matters in which we are involved or new matters could require additional expenditures, in excess of established reserves, over an extended period of time and in a range of amounts that could adversely affect our financial results or affect our reputation. Refer to Part II. *Item 7. Management's Discussion and Analysis of Financial Condition and Results of Operations - Legal and Other Updates* for a discussion of certain legal proceedings with recent developments.

ITEM 1B. UNRESOLVED STAFF COMMENTS

None.

ITEM 2. PROPERTIES

Descriptions of our properties and maps depicting the locations of our liquids and natural gas systems are included in Part I. *Item 1. Busin*ess.

In general, our systems are located on land owned by others and are operated under easements and rights-of-way, licenses, leases or permits that have been granted by private land-owners, First Nations, Native American Tribes, public authorities, railways or public utilities. Our liquids pipeline systems have pumping stations, tanks, terminals and certain other facilities that are located on land that is owned by us and/or used by us under easements, licenses, leases or permits. Additionally, our natural gas pipeline systems have natural gas compressor stations, of which the vast majority are located on land that is owned by us, with the remainder used by us under easements, leases or permits.

Titles to Enbridge owned properties or affiliate entities may be subject to encumbrances in some cases. We believe that none of these burdens should materially detract from the value of these properties or materially interfere with their use in the operation of our business.

ITEM 3. LEGAL PROCEEDINGS

We are involved in various legal and regulatory actions and proceedings which arise in the ordinary course of business. While the final outcome of such actions and proceedings cannot be predicted with certainty, management believes that the resolution of such actions and proceedings will not have a material impact on our consolidated financial position or results of operations. Refer to Part II. *Item 7. Management's Discussion and Analysis of Financial Condition and Results of Operations - Legal and Other Updates* for discussion of certain legal proceedings with recent developments.

SEC regulations require the disclosure of any proceeding under environmental laws to which a governmental authority is a party unless the registrant reasonably believes it will not result in monetary sanctions over a certain threshold. Given the size of our operations, we have elected to use a threshold of US$1 million for the purposes of determining proceedings requiring disclosure.

On October 17, 2022, four separate comprehensive enforcement resolutions were announced with the Minnesota Pollution Control Agency, Minnesota Department of Natural Resources (DNR), Fond du Lac Band of Lake Superior Chippewa, and Minnesota Attorney General's Office related to alleged violations that occurred during construction of Line 3 Replacement. As part of these agreements, together with the DNR's previous Administrative Penalty Order, Enbridge will provide the various entities a total of approximately US$11 million, approximately US$7.5 million of which is to provide financial assurances and fund multiple environmental and resource enhancement projects. The Minnesota Attorney General has filed a misdemeanor criminal charge for the taking of water without a permit at the Clearbrook aquifer, with this charge against us to be dismissed following one year of compliance with the state water appropriation rules.

ITEM 4. MINE SAFETY DISCLOSURES

Not applicable.

PART II

ITEM 5. MARKET FOR REGISTRANT'S COMMON EQUITY, RELATED STOCKHOLDER MATTERS AND ISSUER PURCHASES OF EQUITY SECURITIES

Common Stock

Enbridge common stock is traded on the TSX and NYSE under the symbol ENB. As at February 3, 2023, there were 76,001 registered shareholders of record of Enbridge common stock. A substantially greater number of holders of Enbridge common stock are "street name" or beneficial holders, whose shares are held by banks, brokers and other financial institutions.

Securities Authorized for Issuance Under Equity Compensation Plans

The information required by this Item will be contained in our Form 10-K/A, which will be filed no later than 120 days after December 31, 2022.

Recent Sales of Unregistered Equity Securities

None.

Issuer Purchases of Equity Securities

Period	Total number of shares purchased	Average price paid per share	Total number of shares purchased as part of publicly announced plans or programs	Maximum number of shares that may yet be purchased under the plans or programs[1]
October 2022 (October 1 - October 31)	—	N/A	—	28,324,366
November 2022 (November 1 - November 30)	—	N/A	—	28,324,366
December 2022 (December 1 - December 31)	—	N/A	—	28,324,366

1 *On December 31, 2021, we announced that the TSX approved our prior normal course issuer bid (NCIB) to purchase, for cancellation, up to 31,062,331 of the outstanding common shares of Enbridge to an aggregate amount of up to $1.5 billion. Our prior NCIB commenced on January 5, 2022 and expired on January 4, 2023. On January 4, 2023, we announced that the TSX had approved our new NCIB, which commenced on January 6, 2023 and continues until January 5, 2024. Under the new NCIB, Enbridge may purchase, for cancellation, up to 27,938,163 of its outstanding common shares to an aggregate amount of up to $1.5 billion. Purchases may be made through the facilities of the TSX, the NYSE and other designated exchanges and alternative trading systems.*

Total Shareholder Return

The following graph reflects the comparative changes in the value from January 1, 2018 through December 31, 2022 of $100 invested in (1) Enbridge Inc.'s common shares traded on the TSX, (2) the S&P/TSX Composite index, (3) the S&P 500 index, (4) our US peer group (comprising, by stock symbols, CNP, D, DTE, DUK, EPD, ET, KMI, MMP, NEE, NI, OKE, PAA, PCG, SO, SRE and WMB) and (5) our Canadian peer group (comprising, by stock symbols, CU, FTS, PPL and TRP). The amounts included in the table were calculated assuming the reinvestment of dividends.

	January 1, 2018	December 31, 2018	2019	2020	2021	2022
Enbridge Inc.	100.00	91.90	118.86	100.80	131.30	149.54
S&P/TSX Composite	100.00	91.11	111.96	118.23	147.89	139.25
S&P 500 Index	100.00	95.62	125.72	148.85	191.58	156.88
US Peers[1]	100.00	94.80	114.97	98.40	121.17	134.17
Canadian Peers	100.00	92.00	120.56	99.72	124.49	129.22

1 For the purpose of the graph, it was assumed that CAD:US dollar conversion ratio remained at 1:1 for the years presented.

ITEM 6. [Reserved]

ITEM 7. MANAGEMENT'S DISCUSSION AND ANALYSIS OF FINANCIAL CONDITION AND RESULTS OF OPERATIONS

INTRODUCTION

The following discussion and analysis of our financial condition and results of operations is based on and should be read in conjunction with "Forward-Looking Information" and "Non-GAAP and Other Financial Measures", Part I. *Item 1A. Risk Factors* and our consolidated financial statements and the accompanying notes included in Part II. *Item 8. Financial Statements and Supplementary Data* of this Annual Report on Form 10-K.

This section of our Annual Report on Form 10-K discusses 2022 and 2021 items and year-over-year comparisons between 2022 and 2021. For discussion of 2020 items and year-over-year comparisons between 2021 and 2020, refer to Part II. *Item 7. Management's Discussion and Analysis of Financial Condition and Results of Operations* of our Annual Report on Form 10-K for the year ended December 31, 2021.

RECENT DEVELOPMENTS

Chair of the Board and CEO Appointments

Pamela L. Carter was appointed Chair of the Board of Directors (the Board) effective January 1, 2023. Gregory L. Ebel was appointed as President and Chief Executive Officer (CEO) effective the same date. Mr. Ebel succeeds retiring President and CEO, Al Monaco. To support Mr. Ebel through the transition, Mr. Monaco will serve as an advisor until June 30, 2023. Mr. Ebel will continue as a member of the Board. Ms. Carter has served as a director of the Board since 2017 and with Spectra Energy Corp since 2007. Most recently she has served as Chair of the Human Resources & Compensation Committee of the Board, as a member of the Sustainability and Safety & Reliability Committees and as a former Chair of the Governance Committee.

ASSET TRANSACTIONS

Joint Venture Merger Transaction to Advance US Gulf Coast Oil Strategy

On August 17, 2022, we completed a joint venture merger transaction with Phillips 66 (P66) resulting in a single joint venture, DCP Midstream LLC, holding both Enbridge Inc.'s (Enbridge) and P66's indirect ownership interests in Gray Oak Pipeline, LLC (Gray Oak) and DCP Midstream, LP (DCP), as well as an agreement to realign our respective economic and governance interests in the underlying business operations. Our effective economic interest in Gray Oak has increased to 58.5% from 22.8%, and we will assume operatorship of Gray Oak in the second quarter of 2023. Simultaneously, our effective economic interest in DCP has been reduced to 13.2% from 28.3%. We received approximately \$522 million (US\$404 million) in cash proceeds and recorded an accounting gain of approximately \$1.1 billion (US\$832 million) in the Consolidated Statements of Earnings as a result of the transaction.

Acquisition of Tri Global Energy, LLC

On September 27, 2022, we acquired Tri Global Energy, LLC (TGE), a leading United States (US) renewable power project developer, for approximately US\$270 million in cash and assumed debt. The acquisition of TGE enhances our renewable power platform and further builds on our inventory of North American growth opportunities for wind and solar projects.

Athabasca Indigenous Investments Partnership

On October 5, 2022, we completed a transaction with Athabasca Indigenous Investments Limited Partnership (Aii), a newly created entity representing 23 First Nation and Métis communities, in which Aii acquired an 11.6% non-operating interest in seven Regional Oil Sands pipelines in northern Alberta for \$1.1 billion.

Increased Ownership in Cactus II Pipeline
On November 2, 2022, we acquired an additional 10.0% ownership in Cactus II Pipeline from Western Midstream Partners, L.P., for cash payment of $241 million (US$177 million), bringing our total non-operating ownership to 30.0%. Plains All-American Pipeline, L.P. remains the operator with a 70% ownership stake.

Woodfibre LNG Limited Partnership Agreement
On November 29, 2022, we finalized our partnership agreement with Pacific Energy Corporation Limited. We acquired, for cash payment of $533 million (US$392 million), an effective 30.0% interest in Woodfibre LNG Limited Partnership (Woodfibre), which will operate the 2.1 million tonnes per annum Woodfibre LNG facility located in Squamish, British Columbia (BC). The facility, via an interconnect with FortisBC Energy Inc., is an extension of the BC Pipeline System, which will supply gas to the facility under a 40-year transportation agreement.

GAS TRANSMISSION AND MIDSTREAM PROCEEDINGS
Texas Eastern Transmission
Texas Eastern Transmission, LP (Texas Eastern) filed two rate cases in the third quarter of 2021. These two rate proceedings have since been consolidated and settlement negotiations began during the first quarter of 2022. An uncontested settlement in principle was reached on July 7, 2022. Texas Eastern filed an uncontested Stipulation and Agreement on September 8, 2022 to resolve all issues from the rate proceedings. The Federal Energy Regulatory Commission (FERC) approved the Stipulation and Agreement on November 30, 2022, and the Stipulation and Agreement became effective on January 1, 2023.

Maritimes & Northeast Pipeline
The toll settlement agreement for the Canadian portion of our Maritimes & Northeast (M&N Canada) Pipeline system expired in December 2021. In December 2021, the Canada Energy Regulator (CER) approved interim tolls for M&N Canada effective January 1, 2022, which were based on the negotiated 2022 tolls in the 2022-2023 settlement agreement and unanimously supported by shippers. The 2022-2023 M&N Canada settlement agreement was approved by the CER in February 2022.

British Columbia Pipeline
The toll settlement agreement for our BC Pipeline system expired in December 2021. In December 2021, the CER approved interim tolls for BC Pipeline effective January 1, 2022. In the fourth quarter of 2022, a five-year 2022-2026 BC Pipeline settlement agreement was approved by shippers and subsequently approved as filed by the CER.

GAS DISTRIBUTION AND STORAGE RATE APPLICATIONS
2022 Rate Application
Enbridge Gas Inc.'s (Enbridge Gas) rate applications are filed in two phases. In June 2021, Enbridge Gas filed Phase 1 of the application with the Ontario Energy Board (OEB) for the setting of rates for 2022 (the 2022 Application). The 2022 Application was filed in accordance with the parameters of Enbridge Gas' OEB approved Price Cap Incentive Regulation (IR) rate setting mechanism and represents the fourth year of a five-year term. In October 2021, the OEB approved a Phase 1 Settlement Proposal and Interim Rate Order effective January 1, 2022. In April 2022, the OEB issued its decision on Phase 2 of the 2022 Application filed in October 2021, addressing incremental capital module (ICM) funding requirements, under which $127 million of the requested capital funding was approved and incorporated into final rates, effective July 1, 2022.

2023 Rate Application
In June 2022, Enbridge Gas filed Phase 1 of the application with the OEB for the setting of rates for 2023 (the 2023 Application). The 2023 Application was filed in accordance with the parameters of Enbridge Gas' OEB approved Price Cap IR rate setting mechanism and represents the final year of a five-year term. In November 2022, the OEB approved the Phase 1 Settlement Proposal and Final Rate Order effective January 1, 2023. In addition, Enbridge Gas did not anticipate 2023 capital investments to require incremental funding during the final year of its current Price Cap IR term, and, as such, Enbridge Gas did not make a Phase 2 ICM request as part of the 2023 Application.

2024 Rebasing and Incentive Rate-Setting Mechanism Application
In October 2022, Enbridge Gas filed its application with the OEB to establish a 2024 through 2028 rate setting framework. The application and framework seek approval to establish 2024 base rates on a cost-of-service basis and to establish a price cap IR rate setting mechanism to be used for the remainder of the IR term (2025-2028). The OEB has determined it will hear the application in two phases, with Phase 1 addressing items that affect rates effective January 1, 2024, and Phase 2 addressing items that will affect rates subsequent to January 1, 2024. An OEB decision is expected on Phase 1 of the application in the second half of 2023.

Purchase Gas Variance
The Purchase Gas Variance Account (PGVA) captures the difference between actual and forecasted natural gas prices reflected in rates. Account balances are typically recovered or refunded over a prospective 12-month period through Quarterly Rate Adjustment Mechanism (QRAM) applications.

In March and June 2022, the OEB approved Enbridge Gas' April 1, 2022 and July 1, 2022 QRAM applications, respectively. Due to the significant increase in natural gas prices, the approvals have also included rate mitigation plans intended to ease bill impacts to ratepayers. Specifically, the approved rate mitigation plans extended the PGVA recovery period from 12 months to 24 months in both applications. As an additional mitigation measure, as part of the April 1, 2022 QRAM, a portion of the PGVA balance was deferred for recovery, which was subsequently approved for recovery as part of the July 1, 2022 QRAM. In September and December 2022, the October 1, 2022 and January 1, 2023 QRAM applications were filed and approved by the OEB with no adjustments to the prior period rate mitigation plans and did not include any additional rate mitigation measures.

As at December 31, 2022, Enbridge Gas' PGVA receivable balance was $434 million.

FINANCING UPDATE
We completed long-term debt issuances totaling US$3.2 billion and $3.4 billion during the year ended December 31, 2022, including $900 million of 10-year sustainability-linked medium-term notes in November 2022. We increased our credit facilities during our annual renewal process by approximately $640 million and also entered into new term loans with maturities ranging from 2023 to 2027 totaling approximately $3.2 billion.

Our 2022 financing activities have provided significant liquidity that we expect will enable us to fund our current portfolio of capital projects without requiring access to the capital markets for the next 12 months should market access be restricted or pricing be unattractive. Refer to *Liquidity and Capital Resources*.

As at December 31, 2022, after adjusting for the impact of floating-to-fixed interest rate swap hedges, approximately 6% of our total debt is exposed to floating rates. Refer to Part II. *Item 8. Financial Statements and Supplementary Data - Note 24. Risk Management and Financial Instruments* for more information on our interest rate hedging program.

NORMAL COURSE ISSUER BID

On January 4, 2023, we announced that the Toronto Stock Exchange (TSX) had approved our new normal course issuer bid (NCIB) to purchase for cancellation up to 27,938,163 of the outstanding common shares of Enbridge to an aggregate amount of up to $1.5 billion, subject to certain restrictions on the number of common shares that may be purchased on a single day. The NCIB follows on the termination of our prior NCIB, which expired on January 4, 2023.

Purchases under the NCIB may be made through the facilities of the TSX, the New York Stock Exchange and other designated exchanges and alternative trading systems commencing on January 6, 2023 and continuing until January 5, 2024, when the NCIB expires, or such earlier date on which Enbridge has either acquired the maximum number of common shares allowable under the NCIB or otherwise decided not to make any further repurchases under the NCIB. The maximum number of common shares that Enbridge may purchase for cancellation under the NCIB represents approximately 1.38% of the 2,024,890,423 common shares issued and outstanding as at December 23, 2022.

RESULTS OF OPERATIONS

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars, except per share amounts)			
Segment earnings/(loss) before interest, income taxes and depreciation and amortization[1]			
Liquids Pipelines	**8,364**	7,897	7,683
Gas Transmission and Midstream	**3,126**	3,671	1,087
Gas Distribution and Storage	**1,827**	2,117	1,748

Diluted earnings per common share attributable to common shareholders	**1.28**	2.87	1.48

1 Non-GAAP financial measures.

EARNINGS ATTRIBUTABLE TO COMMON SHAREHOLDERS

Year ended December 31, 2022 compared with year ended December 31, 2021

Earnings attributable to common shareholders decreased by $3,368 million due to certain infrequent or other non-operating factors, primarily explained by the following:

- a goodwill impairment of $2.5 billion relating to our Gas Transmission reporting unit;
- non-cash, net unrealized derivative fair value losses of $1,265 million ($964 million after-tax) in 2022, compared with unrealized gains of $197 million ($150 million after-tax) in 2021, reflecting changes in the mark-to-market value of derivative financial instruments used to manage foreign exchange risks;
- an asset impairment loss of $227 million ($173 million after-tax) to our Magic Valley Wind Farm (Magic Valley);

- an asset impairment loss of $183 million ($137 million after-tax) on the US and Canadian components of the interstate pipeline transportation system within the North Dakota System of our Bakken System;
- a transaction cost of $114 million in relation to our investment purchase in the Woodfibre LNG project;
- an impairment of $44 million ($34 million after-tax) for lease assets due to office relocation plans;
- an asset impairment loss of $40 million ($30 million after-tax) relating to MacKay River line within our Alberta Regional Oil Sands System;
- the absence in 2022 of a gain of $303 million ($298 million after-tax) from the sale of our investment in Noverco Inc. (Noverco); and
- the absence in 2022 of a $57 million ($43 million after-tax) property tax settlement received in 2021 related to the resolution of Minnesota property tax appeals for 2012-2018.

The factors above were partially offset by:
- a gain of $1,076 million ($732 million after-tax) on the closing of the joint venture merger transaction with P66 realigning our effective economic interests in Gray Oak and DCP;
- a gain of $118 million ($89 million after-tax) on Texas Eastern recorded to reflect a settlement with a transportation customer undergoing bankruptcy;
- a deferred tax benefit of $95 million recognized as a result of the reduced Pennsylvania state corporate income tax;
- a non-cash, net negative equity earnings adjustment of $10 million ($7 million after-tax) in 2022, compared to a net negative adjustment of $44 million ($33 million after-tax) in 2021 relating to our share of changes in the mark-to-market value of derivative financial instruments of our equity method investee, DCP;
- transition and transformation costs of $66 million ($50 million after-tax) in 2022, compared to $147 million ($112 million after-tax) in 2021; and
- the absence in 2022 of an impairment loss of $111 million ($83 million after-tax) to our investment in the PennEast Pipeline Company, LLC (PennEast) pipeline project.

The non-cash, unrealized derivative fair value gains and losses discussed above generally arise as a result of our comprehensive economic hedging program to mitigate foreign exchange and commodity price risks. This program creates volatility in reported short-term earnings through the recognition of unrealized non-cash gains and losses on derivative instruments used to hedge these risks. Over the long-term, we believe our hedging program supports the reliable cash flows and dividend growth upon which our investor value proposition is based.

After taking into consideration the factors above, the remaining $141 million increase in earnings attributable to common shareholders is primarily explained by the following significant business factors:
- higher throughput within our Liquids Pipelines segment driven by higher demand and incremental Line 3 Replacement (L3R) capacity that came into service October 2021;
- increased earnings within our Liquids Pipelines segment from the implementation of the full L3R surcharge when compared to the lower surcharge on the Canadian portion of the project in effect prior to October 2021, as well as from new US export assets acquired in October 2021;
- increased earnings from our Gas Transmission and Midstream segment primarily as a result of higher commodity prices benefiting our investments in DCP and Aux Sable, as well as higher contributions from projects placed into service in November 2021; and
- recognition of revenues attributable to the Texas Eastern rate case resulting from a FERC-approved Stipulation and Agreement; partially offset by
- the recognition of a provision against the interim Mainline International Joint Tariff (IJT) for barrels shipped for the full year in 2022, as compared to the barrels shipped in the second half of 2021 following the expiry of the Competitive Toll Settlement (CTS);

- higher interest expense primarily due to higher interest rates and higher average principal, as well as reduced capitalized interest associated with the US portion of the L3R Project placed into service in the fourth quarter of 2021;
- higher depreciation and amortization expense as a result of several projects placed into service in the fourth quarter of 2021, as well as for new US export assets acquired in October 2021; and
- higher income tax expense due to higher earnings, higher US minimum taxes, and the effect of rate-regulated accounting for income taxes.

REVENUES

We generate revenues from three primary sources: transportation and other services, gas distribution sales and commodity sales.

Transportation and other services revenues of $18.5 billion, $16.2 billion and $16.2 billion for the years ended December 31, 2022, 2021 and 2020, respectively, were earned from our crude oil and natural gas pipeline transportation businesses and also include power generation revenues from our portfolio of renewable and power generation assets. For our transportation assets operating under market-based arrangements, revenues are driven by volumes transported and the corresponding tolls for transportation services. For assets operating under take-or-pay contracts, revenues reflect the terms of the underlying contract for services or capacity. For rate-regulated assets, revenues are charged in accordance with tolls established by the regulator and, in most cost-of-service based arrangements, are reflective of our cost to provide the service plus a regulator-approved rate of return.

Gas distribution sales revenues of $5.7 billion, $4.0 billion and $3.7 billion for the years ended December 31, 2022, 2021 and 2020, respectively, were recognized in a manner consistent with the underlying rate-setting mechanism mandated by the regulator. Revenues generated by the gas distribution businesses are primarily driven by volumes delivered, which vary with weather and customer composition and utilization, as well as regulator-approved rates. The cost of natural gas is passed through to customers through rates and does not ultimately impact earnings due to its flow-through nature.

Commodity sales revenues of $29.2 billion, $26.9 billion and $19.3 billion for the years ended December 31, 2022, 2021 and 2020, respectively, were generated primarily through our Energy Services operations. Energy Services includes the contemporaneous purchase and sale of crude oil, natural gas, power and Natural Gas Liquids (NGL) to generate a margin, which is typically a small fraction of gross revenue. While sales revenue generated from these operations are impacted by commodity prices, net margins and earnings are relatively insensitive to commodity prices and reflect activity levels which are driven by differences in commodity prices between locations, grades and points in time, rather than on absolute prices. Any residual commodity margin risk is closely monitored and managed. Revenues from these operations depend on activity levels, which vary from year-to-year depending on market conditions and commodity prices.

Our revenues also include changes in unrealized derivative fair value gains and losses related to foreign exchange and commodity price contracts used to manage exposures from movements in foreign exchange rates and commodity prices. The mark-to-market accounting creates volatility and impacts the comparability of revenues in the short-term, but we believe over the long-term, the economic hedging program supports reliable cash flows.

BUSINESS SEGMENTS

LIQUIDS PIPELINES

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Earnings before interest, income taxes and depreciation and amortization[1]	**8,364**	7,897	7,683

1 Non-GAAP financial measure.

Year ended December 31, 2022 compared with year ended December 31, 2021

EBITDA was negatively impacted by $710 million due to certain infrequent or other non-operating factors, primarily explained by the following:
- non-cash, net unrealized losses of $183 million in 2022, compared with unrealized gains of $120 million in 2021, reflecting net fair value gains and losses arising from changes in the mark-to-market value of derivative financial instruments used to manage foreign exchange risks;
- total asset impairment loss of $183 million on the US and Canadian components of the interstate pipeline transportation system within the North Dakota System of our Bakken System;
- an asset impairment loss of $40 million relating to MacKay River line within our Alberta Regional Oil Sands System; and
- the absence in 2022 of a $57 million property tax settlement received in 2021 related to the resolution of Minnesota property tax appeals for 2012-2018.

After taking into consideration the factors above, the remaining $1.2 billion increase is primarily explained by the following significant business factors:
- higher Mainline System ex-Gretna average throughput of 3.0 million barrels per day (mmbpd) in 2022 as compared to 2.8 mmbpd in 2021 driven by higher demand and incremental L3R capacity that came into service October 2021;
- implementation of the full L3R surcharge when compared to the lower surcharge on the Canadian portion of the project in effect prior to October 2021;
- higher contributions from the Gulf Coast and Mid-Continent System due primarily to the acquisition of the Enbridge Ingleside Energy Center and related assets in the fourth quarter of 2021 in addition to the increased effective economic interest in the Gray Oak pipeline during the third quarter of 2022 and higher volumes from Flanagan South Pipeline;
- higher contributions from the Bakken System due to higher volumes; and
- the favorable effect of translating US dollar EBITDA at a higher average exchange rate in 2022 compared to the same period in 2021; partially offset by
- the recognition of a provision against the interim Mainline IJT for barrels shipped for the full year in 2022, as compared to the barrels shipped in the second half of 2021 following the expiry of the CTS;
- lower contributions from the Seaway Crude Pipeline System, as well as from the Cushing and Hardisty storage assets as a result of lower demand; and
- higher power costs as a result of increased volumes and power prices.

GAS TRANSMISSION AND MIDSTREAM

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Earnings before interest, income taxes and depreciation and amortization[1]	**3,126**	3,671	1,087

1 Non-GAAP financial measure.

Year ended December 31, 2022 compared with year ended December 31, 2021

EBITDA was negatively impacted by $1.1 billion due to certain infrequent or other non-operating factors primarily explained by the following:
- a goodwill impairment of $2.5 billion; partially offset by
- a gain of $1,076 million on the closing of the joint venture merger transaction with P66 realigning our effective economic interests in Gray Oak and DCP;
- the absence of the $111 million impairment loss in 2021 to our investment in the PennEast pipeline project after a decision by project partners to cease development;
- a gain of $118 million on Texas Eastern recorded for a customer bankruptcy settlement; and
- a non-cash, net negative equity earnings adjustment of $10 million in 2022, compared to a net negative adjustment of $44 million in 2021 relating to our share of changes in the mark-to-market value of derivative financial instruments of our equity method investees, DCP and Aux Sable.

After taking into consideration the factors above, we saw a $567 million increase, primarily explained by the following significant business factors:
- higher commodity prices benefiting our DCP and Aux Sable joint ventures;
- the favorable effect of translating US dollar EBITDA at a higher average exchange rate in 2022 compared to the same period in 2021;
- recognition of revenues attributable to the Texas Eastern rate case resulting from a FERC-approved Stipulation and Agreement;
- contributions from the T-South and Spruce Ridge expansion projects, the Cameron and Middlesex Extension projects, and the Appalachia to Market project after service commenced in the fourth quarter of 2021;
- higher AECO-Chicago basis differential and lower costs benefiting earnings from our investment in Alliance; and
- recognition of revenues attributable to the BC Pipeline rate settlement; partially offset by
- higher operating costs; and
- a reduction in earnings from our investment in DCP as a result of our decreased effective economic interest due to the joint venture merger transaction with P66 that closed during the third quarter of 2022.

GAS DISTRIBUTION AND STORAGE

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Earnings before interest, income taxes and depreciation and amortization[1]	**1,827**	2,117	1,748

1 Non-GAAP financial measure.

Year ended December 31, 2022 compared with year ended December 31, 2021

EBITDA was negatively impacted by $293 million due to certain infrequent or other non-operating factors primarily explained by the absence of a gain of $303 million resulting from the sale of our investment in Noverco in 2021.

After taking into consideration the factors above, the remaining $3 million increase is primarily explained by the following significant business factors:

- higher distribution charges at Enbridge Gas resulting from increases in rates and customer base, as well as higher demand in the contract market;
- when compared with the normal weather forecast embedded in rates, colder than normal weather in 2022 positively impacted Enbridge Gas 2022 EBITDA by approximately $17 million while warmer than normal weather in 2021 negatively impacted 2021 EBITDA by approximately $55 million; and
- lower pension related costs; partially offset by
- the absence of earnings from Noverco due to the sale of our minority investment in December 2021; and
- higher operating costs at Enbridge Gas largely driven by higher employee costs and higher maintenance and integrity spend.

RENEWABLE POWER GENERATION

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Earnings before interest, income taxes and depreciation and amortization[1]	**262**	508	523

1 Non-GAAP financial measure.

Year ended December 31, 2022 compared with year ended December 31, 2021

EBITDA was negatively impacted by $272 million due to certain infrequent or non-operating factors, primarily explained by an impairment loss of $227 million to Magic Valley.

After taking into consideration the negative factor above, the remaining $26 million increase is primarily explained by the following significant business factors:

- higher energy pricing at European offshore wind facilities;
- stronger wind resources at Canadian and US onshore wind facilities; and
- the absence in 2022 of the adverse effects from the major winter storm in Texas during February 2021; partially offset by
- the absence in 2022 of a promote fee received in the first quarter of 2021 associated with the closing of the sale of 49% of our interest in three European offshore wind projects to Canada Pension Plan Investment Board.

ENERGY SERVICES

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Earnings/(loss) before interest, income taxes and depreciation and amortization[1]	**(417)**	(313)	(236)

1 Non-GAAP financial measure.

EBITDA from Energy Services is dependent on market conditions and results achieved in one period may not be indicative of results to be achieved in future periods.

Year ended December 31, 2022 compared with year ended December 31, 2021

EBITDA was negatively impacted by $100 million due to certain non-operating factors, primarily explained by non-cash, unrealized losses of $27 million in 2022, compared with unrealized gains of $53 million in 2021, reflecting the revaluation of derivatives used to manage the profitability of transportation and storage transactions, as well as to manage the exposure to movements in commodity prices.

After taking into consideration the factor above, the remaining $4 million decrease is primarily explained by the following significant business factors:

- more pronounced market structure backwardation than in 2021 and significant compression of location differentials in certain markets; partially offset by
- the absence of adverse impacts from the major winter storm experienced across the US Midwest during February 2021.

ELIMINATIONS AND OTHER

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Earnings/(loss) before interest, income taxes and depreciation and amortization[1]	**(1,124)**	356	(113)

1 Non-GAAP financial measure.

Eliminations and Other includes operating and administrative costs that are not allocated to business segments, the impact of foreign exchange hedge settlements and the activities of our wholly-owned captive insurance subsidiaries. Eliminations and Other also includes the impact of new business development activities and corporate investments.

Year ended December 31, 2022 compared with year ended December 31, 2021

EBITDA was negatively impacted by $1.2 billion due to certain infrequent or non-operating factors, primarily explained by:

- non-cash, net unrealized losses of $1,090 million in 2022, compared with unrealized gains of $55 million in 2021, reflecting the change in the mark-to-market value of derivative financial instruments used to manage foreign exchange risk;
- a transaction cost of $114 million in relation to our investment purchase in the Woodfibre LNG project; and
- an impairment of $44 million for lease assets due to office relocation plans in Houston.

After taking into consideration the non-operating factors above, we saw a $239 million decrease in EBITDA that is primarily explained by:

- the lower realized foreign exchange gains on hedge settlements in 2022; and
- higher Operating and administrative expense largely driven by an increase in employee costs.

GROWTH PROJECTS - COMMERCIALLY SECURED PROJECTS

The following table summarizes the status of our significant commercially secured projects, organized by business segment:

		Enbridge's Ownership Interest	Estimated Capital Cost[1]	Expenditures to Date[2]	Status[2]	Expected In-Service Date
(Canadian dollars, unless stated otherwise)						
GAS TRANSMISSION AND MIDSTREAM						
1.	Vito Gas & Oil	100 %	US$0.3 billion	US$0.2 billion	Complete	In-service
2.	Texas Eastern Venice Extension Project	100 %	US$0.4 billion	US$0.1 billion	Pre-construction	2023 - 2024
3.	Texas Eastern Modernization	100 %	US$0.4 billion	No significant expenditures to date	Pre-construction	2024 - 2025
4.	T-North Expansion	100 %	$1.2 billion	No significant expenditures to date	Pre-construction	2026
5.	Woodfibre LNG Project[3]	30 %	US$1.5 billion	No significant expenditures to date	Pre-construction	2027
6.	T-South Expansion	100 %	$3.6 billion	No significant expenditures to date	Pre-construction	2028
RENEWABLE POWER GENERATION						
7.	Saint-Nazaire France Offshore Wind Project[4]	25.5 %	$0.9 billion (€0.6 billion)	$0.9 billion (€0.6 billion)	Complete	In-service
8.	Fécamp Offshore Wind Project[5]	17.9 %	$0.7 billion (€0.5 billion)	$0.4 billion (€0.3 billion)	Under construction	2023
9.	Calvados Offshore Wind Project[4]	21.7 %	$0.9 billion (€0.6 billion)	$0.3 billion (€0.2 billion)	Under construction	2025

1 These amounts are estimates and are subject to upward or downward adjustment based on various factors. Where appropriate, the amounts reflect our share of joint venture projects.
2 Expenditures to date and status of the project are determined as at December 31, 2022.
3 Our equity contribution is US$0.9 billion, with the remainder financed through non-recourse project level debt.
4 Our equity contribution is $0.2 billion for each project, with the remainder of each project financed through non-recourse project level debt.
5 Our equity contribution is $0.1 billion, with the remainder financed through non-recourse project level debt.

Risks related to the development and completion of growth projects are described under Part I. *Item 1A. Risk Factors.*

GAS TRANSMISSION AND MIDSTREAM
The following commercially secured growth project was placed into service in 2022:

- **Vito Gas & Oil** – Two pipelines connecting Vito Floating Production System from Mississippi Canyon to the Shell Mars System platform in West Delta 143 and Olympic Gas. Enbridge designed, fabricated, installed, and now operates, the Vito Gas & Oil export pipeline system consisting of pipeline and steel catenary riser.

The following commercially secured growth projects are currently in various stages of construction:

- **Texas Eastern Venice Extension Project** – A reversal and expansion of Texas Eastern's Line 40 from its existing New Roads compressor station to a new delivery point with the proposed Gator Express pipeline just south of Texas Eastern's Larose compressor station. The project is expected to deliver 1.5 billion cubic feet per day (bcf/d) of natural gas to Venture Global Plaquemines LNG, LLC's LNG export facility located in Plaquemines Parish, Louisiana and is underpinned by long-term take or pay contracts.

- **Texas Eastern Modernization –** This program is the modernization of compression facilities in Pennsylvania and New Jersey to increase safety and reliability and reduce associated greenhouse gas emissions at multiple sites on our Texas Eastern system. The program will be completed in stages over a period of years beginning in 2024.

- **T-North Expansion** – An expansion of Westcoast Energy Inc.'s (Westcoast) BC Pipeline in northern BC that includes pipeline looping, additional compressor units and other ancillary station modifications to support 535 million cubic feet per day (MMcf/d) of additional capacity. The project will be underpinned by a cost-of-service commercial model with a target in-service date of 2026.

- **Woodfibre LNG Project** – Construction of liquefaction and floating storage facilities in Squamish, BC, as well as an expansion of the BC Pipeline System. The project is expected to be placed into service in 2027.

- **T-South Expansion** – An expansion of Westcoast's BC Pipeline's T-South section that includes pipeline looping, additional compressor units and other ancillary station modifications to support 300 MMcf/d of additional capacity. The project is expected to be placed in service in 2028 and will be underpinned by a cost-of-service commercial model.

RENEWABLE POWER GENERATION

The following commercially secured growth projects were placed into service in 2022:

- **Saint-Nazaire Offshore Wind Project –** A wind project located off the west coast of France that is expected to generate approximately 480 megawatts (MW). Project revenues are backed by a 20-year fixed price power purchase agreement (PPA) with added power production protection.

The following commercially secured growth projects are expected to be placed into service from 2023 to 2025:

- **Fécamp Offshore Wind Project –** An offshore wind project that will be comprised of 71 wind turbines located off the northwest coast of France and is expected to generate approximately 500 MW. Project revenues are underpinned by a 20-year fixed price PPA.

- **Calvados Offshore Wind Project –** An offshore wind project located off the northwest coast of France that is expected to generate approximately 448 MW. Project revenues are underpinned by a 20-year fixed price PPA.

OTHER ANNOUNCED PROJECTS UNDER DEVELOPMENT

The following project has been announced by us, but has not yet met our criteria to be classified as commercially secured:

GAS TRANSMISSION AND MIDSTREAM

- **Valley Crossing Expansion Project** – On January 10, 2022, we executed a precedent agreement with Texas LNG Brownsville LLC (Texas LNG) under which, via an expansion of our Valley Crossing Pipeline, we will provide 0.72 bcf/d firm transportation capacity to Texas LNG's proposed LNG liquefaction and export facility in the Port of Brownsville, Texas for a term of at least 20 years. Expansion of the pipeline will be subject to Texas LNG's export facility reaching a final investment decision.

We also have a portfolio of additional projects under development that have not yet progressed to the point of securement.

LIQUIDITY AND CAPITAL RESOURCES

The maintenance of financial strength and flexibility is fundamental to our growth strategy, particularly in light of the significant number and size of capital projects currently secured or under development. Access to timely funding from capital markets could be limited by factors outside our control including, but not limited to, financial market volatility resulting from economic and political events both inside and outside North America. To mitigate such risks, we actively manage financial plans and strategies to ensure we maintain sufficient liquidity to meet routine operating and future capital requirements. In the near term, we generally expect to utilize cash from operations together with commercial paper issuance and/or credit facility draws and the proceeds of capital market offerings to fund liabilities as they become due, finance capital expenditures, fund debt retirements and pay common and preference share dividends. We target to maintain sufficient liquidity through securement of committed credit facilities with a diversified group of banks and financial institutions to enable us to fund all anticipated requirements for approximately one year without accessing the capital markets.

Material contractual obligations arising in the normal course of business primarily consist of long-term contracts, annual debt maturities and related interest obligations, rights-of-way and leases. See Part II. *Item 8. Financial Statements and Supplementary data - Note 18 - Debt* and *Note 27 - Leases* for amounts outstanding at December 31, 2022, related to debt and leases.

Long-term contracts are contracts that we have signed for the purchase of services, pipe and other materials totaling $7.9 billion which are expected to be paid over the next five years. Long-term contracts primarily consists of the following purchase obligations: firm capacity payments for natural gas and crude oil transportation and storage contracts, natural gas purchase commitments, service and product purchase obligations and power commitments.

Our financing plan is regularly updated to reflect evolving capital requirements and financial market conditions and identifies a variety of potential sources of debt and equity funding alternatives. Our current financing plan does not include any issuances of common equity.

CAPITAL MARKET ACCESS

We ensure ready access to capital markets, subject to market conditions, through maintenance of shelf prospectuses that allow for issuance of long-term debt, equity and other forms of long-term capital when market conditions are attractive. In accordance with our funding plan, we completed the following long-term debt issuances totaling US$3.2 billion and $3.4 billion in 2022:

Entity	Issuance date	Type of issuance	Amount
(in millions of Canadian dollars, unless stated otherwise)			
Enbridge Inc.	January 2022	Fixed-to-fixed subordinated notes	$750
Enbridge Inc.	February 2022	Floating rate senior notes	US$600
Enbridge Inc.	February 2022	Senior notes	US$900
Enbridge Inc.	September 2022	Fixed-to-fixed subordinated notes	US$1,100
Enbridge Inc.	November 2022	Medium-term notes	$1,100
Enbridge Inc.	November 2022	Sustainability-linked medium-term notes	$900
Enbridge Gas Inc.	August 2022	Medium-term notes	$650
Texas Eastern Transmission LP	December 2022	Senior notes	US$600

Credit Facilities, Ratings and Liquidity

To ensure ongoing liquidity and to mitigate the risk of capital market disruption, we maintain ready access to funds through committed bank credit facilities and actively manage our bank funding sources to optimize pricing and other terms. The following table provides details of our committed credit facilities, inclusive of term loans, at December 31, 2022:

	Maturity[1]	Total Facilities	Draws[2]	Available
(millions of Canadian dollars)				
Enbridge Inc.	2023-2027	**10,987**	**7,984**	**3,003**
Enbridge (U.S.) Inc.	2024-2027	**8,604**	**4,199**	**4,405**
Enbridge Pipelines Inc.	2024	**2,000**	**312**	**1,688**
Enbridge Gas Inc.	2024	**2,000**	**2,000**	**—**
Total committed credit facilities		**23,591**	**14,495**	**9,096**

1 Maturity date is inclusive of the one-year term out option for certain credit facilities.
2 Includes facility draws and commercial paper issuances that are back-stopped by credit facilities.

On February 10, 2022, we renewed our three year $1.0 billion sustainability-linked credit facility, extending the maturity date out to July 2025.

On May 17, 2022, we entered into a three year term loan with a syndicate of Japanese banks for approximately $806 million (¥84.8 billion), which will mature in May 2025 and replaces the approximately $499 million (¥52.5 billion) term loan that matured in May 2022. Additionally, on May 24, 2022, we entered into a 364-day term loan for approximately $1.9 billion, which will mature in May 2023.

On June 23, 2022, we renewed approximately $5.5 billion of our 364-day extendible credit facilities to July 2024, which includes a one-year term out provision from July 2023.

In July and August 2022, we renewed $12.7 billion of our credit facilities, extending the maturity dates of our 364-day credit facilities to July 2024, inclusive of a one year term out provision from July 2023, and our five year facilities out to July 2027. As a part of the renewals, we increased our credit facilities by approximately $640 million.

On December 16, 2022, Enbridge (U.S.) Inc. entered into a five year delay draw term loan in support of solar self-power projects for approximately $479 million, which will mature in December 2027.

In addition to the committed credit facilities noted above, we maintain $1.3 billion of uncommitted demand letter of credit facilities, of which $689 million was unutilized as at December 31, 2022. As at December 31, 2021, we had $1.3 billion of uncommitted demand letter of credit facilities, of which $854 million was unutilized.

As at December 31, 2022, our net available liquidity totaled $10.0 billion (2021 - $6.5 billion), consisting of available credit facilities of $9.1 billion (2021 - $6.2 billion) and unrestricted Cash and cash equivalents of $861 million (2021 - $286 million) as reported in the Consolidated Statements of Financial Position.

Our credit facility agreements and term debt indentures include standard events of default and covenant provisions, whereby accelerated repayment and/or termination of the agreements may result if we were to default on payment or violate certain covenants. As at December 31, 2022, we were in compliance with all debt covenants and expect to continue to comply with such covenants.

Cash flow growth, ready access to liquidity from diversified sources and a stable business model have enabled us to manage our credit profile. We actively monitor and manage key financial metrics with the objective of sustaining investment grade credit ratings from the major credit rating agencies and ongoing access to bank funding and term debt capital on attractive terms. In 2022, our credit ratings with DBRS Morningstar, Fitch Ratings, Moody's Investor Services, Inc. and Standard & Poor's were all affirmed. Key measures of financial strength that are closely managed include the ability to service debt obligations from operating cash flow and the ratio of debt to EBITDA.

There are no material restrictions on our cash. Total Restricted cash of $46 million, as reported in the Consolidated Statements of Financial Position, primarily includes cash collateral and future pipeline abandonment costs collected and held in trust. Cash and cash equivalents held by certain subsidiaries may not be readily accessible for alternative use by us.

Excluding current maturities of long-term debt, as at December 31, 2022 and 2021, we had a negative working capital position of $2.1 billion and $3.1 billion, respectively. In both periods, the major contributing factor to the negative working capital position was the current liabilities associated with our growth capital program.

To address this negative working capital position, we maintain significant liquidity in the form of committed credit facilities and other sources as previously discussed, which enable the funding of liabilities as they become due.

SOURCES AND USES OF CASH

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Operating activities	**11,230**	9,256	9,781
Investing activities	**(5,270)**	(10,657)	(5,177)
Financing activities	**(5,428)**	1,236	(4,770)
Effect of translation of foreign denominated cash and cash equivalents and restricted cash	**55**	(5)	(20)
Net change in cash and cash equivalents and restricted cash	**587**	(170)	(186)

Significant sources and uses of cash for the years ended December 31, 2022 and 2021 are summarized below:

Operating Activities
Typically, the primary factors impacting cash flow from operating activities year-over-year include changes in our operating assets and liabilities in the normal course due to various factors, including the impact of fluctuations in commodity prices and activity levels on working capital within our business segments, the timing of tax payments, as well as timing of cash receipts and payments generally. Refer to Part II. *Item 8. Financial Statements and Supplementary Data - Note 29. Changes in Operating Assets and Liabilities.* Cash provided by operating activities is also impacted by changes in earnings and certain infrequent or other non-operating factors, as discussed under *Results of Operations.*

Investing Activities
Cash used in investing activities primarily relates to capital expenditures to execute our capital program, which is further described in *Growth Projects - Commercially Secured Projects*. The timing of project approval, construction and in-service dates impacts the timing of cash requirements.

A summary of additions to property, plant and equipment for the years ended December 31, 2022, 2021 and 2020 is set out below:

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Liquids Pipelines	**1,418**	4,051	2,032
Gas Transmission and Midstream	**1,647**	2,353	2,066
Gas Distribution and Storage	**1,499**	1,343	1,134
Renewable Power Generation	**50**	16	81
Energy Services	**—**	1	2
Eliminations and Other	**33**	54	90
Total capital expenditures	**4,647**	7,818	5,405

2022
The decrease in cash used in investing activities primarily resulted from the following factors:

- lower capital expenditures due to the US L3R Program that was placed into service in the fourth quarter of 2021;
- lower cash outflows related to acquisitions in 2022 when compared to 2021; and
- proceeds received from the completion of a joint venture merger transaction for DCP Midstream LLC in August 2022.

The factors above were partially offset by:

- the absence in 2022 of proceeds received from dispositions in 2021 related to sale of our interest in Noverco in December 2021; and
- increased investments held by our wholly-owned captive insurance subsidiaries.

2021
The increase in cash used in investing activities primarily resulted from our acquisition of Moda Midstream Operating, LLC and higher capital expenditures related to the completion of the US L3R Program in 2021, partially offset by higher proceeds received from dispositions in 2021 compared to 2020 due to the sale of our interest in Noverco.

Financing Activities
Cash used in financing activities primarily relates to issuances and repayments of external debt, as well as transactions with our common and preference shareholders relating to dividends, share issuances, share redemptions and common share repurchases under our NCIB. Cash flow from financing activities is also impacted by changes in distributions to, and contributions from, noncontrolling interests.

2022
The increase in cash used in financing activities primarily resulted from the following factors:

- net commercial paper and credit facility repayments in 2022 when compared to draws in 2021;
- higher long-term debt repayments along with lower long-term debt issuances in 2022 when compared to 2021;
- the redemption of Preference Shares, Series 17 and Series J in the first and second quarters of 2022, respectively;
- the repurchase and cancellation of 2,737,965 common shares under our NCIB for approximately $151 million in 2022; and
- increased common share dividend payments primarily due to the increase in our common share dividend rate.

The factors above were partially offset by:

- proceeds received from the sale of a non-operating interest in seven pipelines from our Regional Oil Sands System in October 2022;
- the absence in 2022 of the redemption of Westcoast's preferred shares in the first quarter of 2021; and
- higher short-term borrowings in 2022 when compared to 2021.

2021
The increase in cash provided by financing activities primarily resulted from increased issuances of long-term debt, commercial paper and credit facility draws and short-term borrowings, along with lower repayments of long-term debt in 2021 when compared to 2020.

The factors above were partially offset by the redemption of Westcoast's preferred shares in 2021 and increased common share dividend payments primarily due to the increase in our common share dividend rate.

OFF-BALANCE SHEET ARRANGEMENTS

We enter into guarantee arrangements in the normal course of business to facilitate commercial transactions with third parties and can include financial guarantees, stand-by letters of credit, debt guarantees, surety bonds and indemnifications. Please see Part II. *Item 8. Financial Statements and Supplementary Data - Note 32. Guarantees* for further discussion of guarantee arrangements.

We do not have material off-balance sheet financing entities or structures, except for guarantee arrangements and financings entered into by our equity investments. For additional information on these commitments, please refer to Part II. *Item 8. Financial Statements and Supplementary Data - Note 31. Commitments and Contingencies* and *Note 12. Variable Interest Entities.*

We do not have material off-balance sheet arrangements that have or are reasonably likely to have a current or future effect on our financial condition, revenues or expenses, results of operations, liquidity, capital expenditures or capital resources.

PREFERENCE SHARE ISSUANCES

Characteristics of our outstanding preference shares are as follows:

	Dividend Rate	Dividend[1]	Per Share Base Redemption Value[2]	Redemption and Conversion Option Date[2,3]	Right to Convert Into[3,4]
(Canadian dollars, unless otherwise stated)					
Preference Shares, Series A	5.50 %	$1.37500	$25	—	—
Preference Shares, Series B[5]	5.20 %	$1.30052	$25	June 1, 2027	Series C
Preference Shares, Series D	4.46 %	$1.11500	$25	March 1, 2023	Series E
Preference Shares, Series F	4.69 %	$1.17224	$25	June 1, 2023	Series G
Preference Shares, Series H	4.38 %	$1.09400	$25	September 1, 2023	Series I
Preference Shares, Series L[6]	5.86 %	US$1.46448	US$25	September 1, 2027	Series M
Preference Shares, Series N	5.09 %	$1.27152	$25	December 1, 2023	Series O
Preference Shares, Series P	4.38 %	$1.09476	$25	March 1, 2024	Series Q
Preference Shares, Series R	4.07 %	$1.01825	$25	June 1, 2024	Series S
Preference Shares, Series 1	5.95 %	US$1.48728	US$25	June 1, 2023	Series 2
Preference Shares, Series 3	3.74 %	$0.93425	$25	September 1, 2024	Series 4
Preference Shares, Series 5	5.38 %	US$1.34383	US$25	March 1, 2024	Series 6
Preference Shares, Series 7	4.45 %	$1.11224	$25	March 1, 2024	Series 8
Preference Shares, Series 9	4.10 %	$1.02424	$25	December 1, 2024	Series 10
Preference Shares, Series 11	3.94 %	$0.98452	$25	March 1, 2025	Series 12
Preference Shares, Series 13	3.04 %	$0.76076	$25	June 1, 2025	Series 14
Preference Shares, Series 15	2.98 %	$0.74576	$25	September 1, 2025	Series 16
Preference Shares, Series 19	4.90 %	$1.22500	$25	March 1, 2023	Series 20

1 *The holder is entitled to receive a fixed, cumulative, quarterly preferential dividend, as declared by the Board of Directors. With the exception of Preference Shares, Series A, such fixed dividend rate resets every five years beginning on the initial redemption and conversion option date. The Preference Shares, Series 19 contain a feature where the fixed dividend rate, when reset every five years, will not be less than 4.90%. No other series of Preference Shares has this feature.*

2 *Preference Shares, Series A may be redeemed any time at our option. For all other series of preference shares, we may at our option, redeem all or a portion of the outstanding preference shares for the Base Redemption Value per share plus all accrued and unpaid dividends on the Redemption Option Date and on every fifth anniversary thereafter.*

3 *The holder will have the right, subject to certain conditions, to convert their shares into Cumulative Redeemable Preference Shares of a specified series on a one-for-one basis on the Conversion Option Date and every fifth anniversary thereafter at an ascribed issue price equal to the Base Redemption Value.*

4 *With the exception of Preference Shares, Series A, after the redemption and conversion option dates, holders may elect to receive quarterly floating rate cumulative dividends per share at a rate equal to: $25 x (number of days in quarter/number of days in year) x Three-Month Government of Canada treasury bill rate + 2.4% (Series C), 2.4% (Series E), 2.5% (Series G), 2.1% (Series I), 2.7% (Series O), 2.5% (Series Q), 2.5% (Series S), 2.4% (Series 4), 2.6% (Series 8), 2.7% (Series 10), 2.6% (Series 12), 2.7% (Series 14), 2.7% (Series 16), or 3.2% (Series 20); or US$25 x (number of days in quarter/number of days in year) x Three-Month US Government treasury bill rate + 3.2% (Series M), 3.1% (Series 2) or 2.8% (Series 6).*

5 *The quarterly dividend per share paid on Preference Shares, Series B was increased to $0.32513 from $0.21340 on June 1, 2022 due to reset of the annual dividend on June 1, 2022. On June 1, 2022, all outstanding Preference Shares, Series C were converted to Preference Shares, Series B.*

6 *The quarterly dividend per share paid on Preference Shares, Series L was increased to US$0.36612 from US$0.30993 on September 1, 2022, due to reset of the annual dividend on September 1, 2022.*

PREFERENCE SHARE REDEMPTIONS

On March 1, 2022, we redeemed our $750 million outstanding Cumulative Redeemable Minimum Rate Reset Preference Shares, Series 17. On June 1, 2022, we also redeemed our US$200 million outstanding Cumulative Redeemable Preference Shares, Series J. Dividends are cumulative, payable quarterly and are included in Preference share dividends in the Consolidated Statements of Earnings.

DIVIDENDS

We have paid common share dividends in every year since we became a publicly traded company in 1953. In November 2022, we announced a 3.2% increase in our quarterly dividend to $0.88750 per common share, or $3.55 annualized, effective with the dividend payable on March 1, 2023, thereby declaring a dividend increase for 28 straight years.

For the years ended December 31, 2022 and 2021, total dividends paid were $7.0 billion and $6.8 billion, respectively, all of which were paid in cash and reflected in financing activities.

On November 29, 2022, our Board of Directors declared the following quarterly dividends. All dividends are payable on March 1, 2023 to shareholders of record on February 15, 2023.

	Dividend per share
Common Shares[1]	$0.88750
Preference Shares, Series A	$0.34375
Preference Shares, Series B[2]	$0.32513
Preference Shares, Series D	$0.27875
Preference Shares, Series F	$0.29306
Preference Shares, Series H	$0.27350
Preference Shares, Series L[3]	US$0.36612
Preference Shares, Series N	$0.31788
Preference Shares, Series P	$0.27369
Preference Shares, Series R	$0.25456
Preference Shares, Series 1	US$0.37182
Preference Shares, Series 3	$0.23356
Preference Shares, Series 5	US$0.33596
Preference Shares, Series 7	$0.27806
Preference Shares, Series 9	$0.25606
Preference Shares, Series 11	$0.24613
Preference Shares, Series 13	$0.19019
Preference Shares, Series 15	$0.18644
Preference Shares, Series 19	$0.30625

1 The quarterly dividend per common share was increased 3.2% to $0.8875 from $0.860, effective March 1, 2023.
2 The quarterly dividend per share paid on Preference Shares Series B was increased to $0.32513 from $0.21340 on June 1, 2022, due to reset of the annual dividend on June 1, 2022 and every five years thereafter. Following the date of conversion of Preference Shares Series C, on June 1, 2022 all outstanding Preference Shares Series C were converted to Preference Shares Series B.
3 The quarterly dividend per share paid on Series L was increased to US$0.36612 from US$0.30993 on September 1, 2022, due to reset of the annual dividend on September 1, 2022, and every five years thereafter.

SUMMARIZED FINANCIAL INFORMATION

On January 22, 2019, Enbridge entered into supplemental indentures with its wholly-owned subsidiaries, Spectra Energy Partners, LP (SEP) and Enbridge Energy Partners, L.P. (EEP) (the Partnerships), pursuant to which Enbridge fully and unconditionally guaranteed, on a senior unsecured basis, the payment obligations of the Partnerships with respect to the outstanding series of notes issued under the respective indentures of the Partnerships. Concurrently, the Partnerships entered into a subsidiary guarantee agreement pursuant to which they fully and unconditionally guaranteed, on a senior unsecured basis, the outstanding series of senior notes of Enbridge. The Partnerships have also entered into supplemental indentures with Enbridge pursuant to which the Partnerships have issued full and unconditional guarantees, on a senior unsecured basis, of senior notes issued by Enbridge subsequent to January 22, 2019. As a result of the guarantees, holders of any of the outstanding guaranteed notes of the Partnerships (the Guaranteed Partnership Notes) are in the same position with respect to the net assets, income and cash flows of Enbridge as holders of Enbridge's outstanding guaranteed notes (the Guaranteed Enbridge Notes), and vice versa. Other than the Partnerships, Enbridge subsidiaries (including the subsidiaries of the Partnerships, collectively, the Subsidiary Non-Guarantors), are not parties to the subsidiary guarantee agreement and have not otherwise guaranteed any of Enbridge's outstanding series of senior notes.

Consenting SEP notes and EEP notes under Guarantee

SEP Notes[1]	EEP Notes[2]
4.750% Senior Notes due 2024	5.875% Notes due 2025
3.500% Senior Notes due 2025	5.950% Notes due 2033
3.375% Senior Notes due 2026	6.300% Notes due 2034
5.950% Senior Notes due 2043	7.500% Notes due 2038
4.500% Senior Notes due 2045	5.500% Notes due 2040
	7.375% Notes due 2045

1 As at December 31, 2022, the aggregate outstanding principal amount of SEP notes was approximately US$3.2 billion.
2 As at December 31, 2022, the aggregate outstanding principal amount of EEP notes was approximately US$2.4 billion.

Long-term loans payable to affiliates	**37,626**	41,370
Other long-term liabilities	**47,447**	41,353

The Guaranteed Enbridge Notes and the Guaranteed Partnership Notes are structurally subordinated to the indebtedness of the Subsidiary Non-Guarantors in respect of the assets of those Subsidiary Non-Guarantors.

Under US bankruptcy law and comparable provisions of state fraudulent transfer laws, a guarantee can be voided, or claims may be subordinated to all other debts of that guarantor if, among other things, the guarantor, at the time the indebtedness evidenced by its guarantee or, in some states, when payments become due under the guarantee:

- received less than reasonably equivalent value or fair consideration for the incurrence of the guarantee and was insolvent or rendered insolvent by reason of such incurrence;
- was engaged in a business or transaction for which the guarantor's remaining assets constituted unreasonably small capital; or
- intended to incur, or believed that it would incur, debts beyond its ability to pay those debts as they mature.

The guarantees of the Guaranteed Enbridge Notes contain provisions to limit the maximum amount of liability that the Partnerships could incur without causing the incurrence of obligations under the guarantee to be a fraudulent conveyance or fraudulent transfer under US federal or state law.

Each of the Partnerships is entitled to a right of contribution from the other Partnership for 50% of all payments, damages and expenses incurred by that Partnership in discharging its obligations under the guarantees for the Guaranteed Enbridge Notes.

Under the terms of the guarantee agreement and applicable supplemental indentures, the guarantees of either of the Partnerships of any Guaranteed Enbridge Notes will be unconditionally released and discharged automatically upon the occurrence of any of the following events:

- any direct or indirect sale, exchange or transfer, whether by way of merger, sale or transfer of equity interests or otherwise, to any person that is not an affiliate of Enbridge, of any of Enbridge's direct or indirect limited partnership of other equity interests in that Partnership as a result of which the Partnership ceases to be a consolidated subsidiary of Enbridge;
- the merger of that Partnership into Enbridge or the other Partnership or the liquidation and dissolution of that Partnership;
- the repayment in full or discharge or defeasance of those Guaranteed Enbridge Notes, as contemplated by the applicable indenture or guarantee agreement;
- with respect to EEP, the repayment in full or discharge or defeasance of each of the consenting EEP notes listed above;
- with respect to SEP, the repayment in full or discharge or defeasance of each of the consenting SEP notes listed above; or
- with respect to any series of Guaranteed Enbridge Notes, with the consent of holders of at least a majority of the outstanding principal amount of that series of Guaranteed Enbridge Notes.

The guarantee obligations of Enbridge will terminate with respect to any series of Guaranteed Partnership Notes if that series is discharged or defeased.

The Partnerships also guarantee the obligations of Enbridge under its existing credit facilities**.**

LEGAL AND OTHER UPDATES

LIQUIDS PIPELINES
Line 5 Easement (Bad River Band)
On July 23, 2019, the Bad River Band of the Lake Superior Tribe of Chippewa Indians (the Band) filed a complaint in the United States District Court for the Western District of Wisconsin (the Court) over our Line 5 pipeline and right-of-way across the Bad River Reservation (the Reservation). Only a small portion of the total easements across 12 miles of the Reservation are at issue. The Band alleges that our continued use of Line 5 to transport crude oil and related liquids across the Reservation is a public nuisance under federal and state law and that the pipeline is in trespass on certain tracts of land in which the Band possesses ownership interests. The complaint seeks an Order prohibiting us from using Line 5 to transport crude oil and related liquids across the Reservation and requiring removal of the pipeline from the Reservation. Subsequently amended versions of the complaint also seek recovery of profits-based damages based on an unjust enrichment theory. Enbridge has responded to each claim in the initial and amended complaints with an answer, defenses and counterclaims.

On August 29, 2022, the Government of Canada released a statement formally invoking the dispute settlement provisions of the 1977 Transit Pipelines Treaty in respect of this litigation; reiterating its concerns about the uninterrupted transmission of hydrocarbons through Line 5. On September 7, 2022, the Court issued a decision on cross-motions for summary judgment. The Court determined that the Band's nuisance claim raised factual issues that could not be resolved on summary judgment. The Court further determined that Enbridge is in trespass on 12 parcels on the Reservation and that the Band is entitled to some measure of profits-based damages and to an injunction, with the level of damages and scope of the injunction to be determined at trial, which occurred between October 24 and November 1, 2022. While the Court reserved judgment at the conclusion of the trial, the summary judgment decision and subsequent pre-trial decisions provide that the Court will assess trespass damages calculated using a pro-rata share of Enbridge's profits from the operation of the pipeline attributable to the 12 disputed parcels compared to the pipeline as a whole rather than the profits associated with the entire length of the pipeline, as the Band sought. The Court has also stated that any injunction will not result in the immediate closure of the pipeline but also will not allow the pipeline to operate indefinitely. On November 28, 2022, the Court issued an interim Order ruling that: (a) the parties are to meet and confer by December 16 on installation of EFRDs (Emergency Flow Restriction Devices) on the Reservation, an appropriate shutdown and purge protocol should conditions worsen at the meander, and any other reasonable remediation projects that could inhibit further erosion at the meander; (b) the parties are to submit a Joint Proposal by December 23 on appropriate shutoff and purge plan for the meander, or if they cannot agree, each party must submit their own best offer on a shutdown and purge protocol; and (c) denied Enbridge's request for declaratory and injunctive relief on its counterclaims asking for Court-Ordered relief relating to access and erosion mitigation at the meander. The parties met and conferred by December 16 and a Joint Status Report, along with individual best offers on shutdown and purge protocol, were filed on December 23. We continue to wait on the Court's rulings on the issues of financial compensation and Line 5's operations.

Michigan Line 5 Dual Pipelines - Straits of Mackinac Easement

In 2019, the Michigan Attorney General (AG) filed a complaint in the Michigan Ingham County Circuit Court (the Circuit Court) that requests the Circuit Court to declare the easement granted in 1953 that we have for the operation of Line 5 in the Straits of Mackinac (the Straits) to be invalid and to prohibit continued operation of Line 5 in the Straits. On December 15, 2021, we removed the case to the US District Court in the Western District of Michigan (US District Court), where it was assigned to Judge Janet T. Neff. The removal of the AG's case to federal court follows a November 16, 2021 ruling which held that the similar (and now dismissed) 2020 lawsuit brought by the Governor of Michigan to force Line 5's shutdown raised important federal issues that should be heard in federal court. On December 21, 2021, the AG made a request to file a remand motion and on December 28, 2021, we responded to her request to file that motion. On January 5, 2022, the court issued an Order allowing the AG to file a motion to remand the 2019 case. The AG's motion and brief were filed on January 14, 2022, and our response was filed on February 11, 2022. The motion was fully briefed in March 2022. On August 18, 2022, Judge Neff denied the AG's motion to remand which now remains in the US District Court. On August 30, 2022, the AG filed a motion to certify the US District Court's August 18 Order to pursue an appeal on the jurisdictional issue, which Enbridge opposed. We anticipate a decision on the jurisdictional issue in 2023.

Dakota Access Pipeline

We own an effective interest of 27.6% in the Bakken Pipeline System, which is inclusive of the Dakota Access Pipeline (DAPL). The Standing Rock Sioux Tribe and the Cheyenne River Sioux Tribe filed lawsuits in 2016 with the US Court for the District of Columbia (the District Court) contesting the lawfulness of the Army Corps easement for DAPL, including the adequacy of the Army Corps' environmental review and tribal consultation process. The Oglala Sioux and Yankton Sioux Tribes also filed lawsuits alleging similar claims in 2018.

On June 14, 2017, the District Court found the Army Corps' environmental review to be deficient and ordered the Army Corps to conduct further study concerning spill risks from DAPL. In August 2018, the Army Corps completed on remand the further environmental review ordered by the District Court and reaffirmed the issuance of the easement for DAPL. All four plaintiff Tribes subsequently amended their complaints to include claims challenging the adequacy of the Army Corps' August 2018 remand decision.

On March 25, 2020, in response to amended complaints from the Tribes, the District Court found the Army Corps' environmental review on remand was deficient and ordered the Army Corps to prepare an Environmental Impact Statement (EIS) to address unresolved controversy pertaining to potential spill impacts resulting from DAPL. On July 6, 2020, the District Court issued an order vacating the Army Corps' easement for DAPL and ordering that the pipeline be shut down by August 5, 2020. Dakota Access, LLC and the Army Corps appealed the decision and filed a motion for a stay pending appeal with the US Court of Appeals for the District of Columbia Circuit. On August 5, 2020, the US Court of Appeals stayed the District Court's July 6 order to shut down and empty the pipeline, but did not stay the District Court's March 25 order requiring the Army Corps to prepare an EIS or the District Court's July 6 order vacating the DAPL easement.

On January 26, 2021, the US Court of Appeals affirmed the District Court's decision, holding that the Army Corps is required to prepare an EIS and that the Army Corps' easement for DAPL is vacated. On February 22, 2022, the US Supreme Court denied the request of Dakota Access, LLC to review the decision that an EIS is required. The US Court of Appeals also determined that, absent considering the closure of DAPL in the context of an injunction proceeding, the District Court could not order DAPL's operations to cease. While not an issue before the US Court of Appeals, the US Court of Appeals also recognized that the Army Corps could consider whether to allow DAPL to continue to operate in the absence of an easement.

On May 21, 2021, the District Court dismissed the plaintiff Tribes' request for an injunction enjoining DAPL from operating until the Army Corps has completed its EIS. The right of the plaintiff Tribes to appeal the denial of the injunction request expired on July 20, 2021. The Army Corps earlier indicated that it did not intend, at that time, to exercise its authority to bar DAPL's continued operation, notwithstanding the absence of an easement and that it anticipates completion of the EIS process.

On July 22, 2021, the Army Corps filed a notice with the District Court advising that the Pipeline and Hazardous Materials Safety Administration (PHMSA) issued a notice asserting violations of federal safety regulations resulting from the operation of DAPL. The Army Corps stated that it would consider PHMSA's notice as part of its ongoing consideration of whether and how the Army Corps will enforce its rights on property crossed by the pipeline and in the context of the ongoing EIS. The Army Corps also granted the request from the Tribes to extend the draft EIS completion date to September 2022. The Army Corps now expects to complete the draft EIS in the spring of 2023.

OTHER LITIGATION
We and our subsidiaries are subject to various other legal and regulatory actions and proceedings which arise in the normal course of business, including interventions in regulatory proceedings and challenges to regulatory approvals and permits. While the final outcome of such actions and proceedings cannot be predicted with certainty, management believes that the resolution of such actions and proceedings will not have a material impact on our consolidated financial position or results of operations.

TAX MATTERS
We and our subsidiaries maintain tax liabilities related to uncertain tax positions. While fully supportable in our view, these tax positions, if challenged by tax authorities, may not be fully sustained on review.

CRITICAL ACCOUNTING ESTIMATES

Our consolidated financial statements are prepared in accordance with generally accepted accounting principles in the United States of America (US GAAP), which require management to make estimates, judgments and assumptions that affect the amounts reported in our consolidated financial statements and accompanying notes. In making judgments and estimates, management relies on external information and observable conditions, where possible, supplemented by internal analysis as required. We believe our most critical accounting policies and estimates discussed below have an impact across the various segments of our business.

BUSINESS COMBINATIONS

We apply the provisions of Accounting Standards Codification (ASC) 805 *Business Combinations* in accounting for our acquisitions. The acquired long-lived assets, intangible assets and assumed liabilities are recorded at their estimated fair values at the date of acquisition. Goodwill represents the excess of the purchase price over the fair value of net assets. While we use our best estimates and assumptions to accurately value assets acquired and liabilities assumed at the date of acquisition, as well as any contingent consideration, our estimates are inherently uncertain and subject to refinement. During the measurement period, which may be up to one year from the acquisition date, we record adjustments to the assets acquired and liabilities assumed with the corresponding offset to goodwill. Upon the conclusion of the measurement period or final determination of values of assets acquired or liabilities assumed, whichever comes first, any subsequent adjustments are recorded to our consolidated statements of operations.

Accounting for business combinations requires significant judgment, estimates and assumptions at the acquisition date. In developing estimates of fair values at the acquisition date, we utilize a variety of factors including market data, historical and future expected cash flows, growth rates and discount rates. The subjective nature of our assumptions increases the risk associated with estimates surrounding the projected performance of the acquired entity.

GOODWILL IMPAIRMENT

Goodwill represents the excess of the purchase price over the fair value of net identifiable assets upon acquisition of a business. The carrying value of goodwill, which is not amortized, is assessed for impairment annually or more frequently if events or changes in circumstances arise that suggest the carrying value of goodwill may be impaired. We perform our annual review of the goodwill balance on April 1.

We perform our annual review for impairment at the reporting unit level, which is identified by assessing whether the components of our operating segments constitute businesses for which discrete information is available, whether segment management regularly reviews the operating results of those components and whether the economic and regulatory characteristics are similar. Our reporting units are Liquids Pipelines, Gas Transmission, Gas Distribution and Storage and Renewable Power Generation. The Renewable Power Generation reporting unit had goodwill starting in the third quarter of 2022.

We have the option to first assess qualitative factors to determine whether it is necessary to perform the quantitative goodwill impairment assessment. When performing a qualitative assessment, we determine the drivers of fair value for each reporting unit and evaluate whether those drivers have been positively or negatively affected by relevant events and circumstances since the last fair value assessment. Our evaluation includes, but is not limited to, the assessment of macroeconomic trends, changes to regulatory environments, capital accessibility, operating income trends and changes to industry conditions. Based on our assessment of qualitative factors, if we determine it is more likely than not that the fair value of the reporting unit is less than its carrying amount, a quantitative goodwill impairment assessment is performed.

The quantitative goodwill impairment assessment involves determining the fair value of our reporting units and comparing those values to the carrying value of each reporting unit. If the carrying value of a reporting unit, including allocated goodwill, exceeds its fair value, goodwill impairment is measured at the amount by which the reporting unit's carrying value exceeds its fair value. This amount should not exceed the carrying amount of goodwill. The fair value of our reporting units is estimated using a combination of discounted cash flow and earnings multiples techniques. The determination of fair value using the discounted cash flow technique requires the use of estimates and assumptions related to discount rates, projected operating income, expected future capital expenditures and working capital levels, as well as terminal value growth rates for the Liquids Pipelines, Gas Transmission and Renewable Power Generation reporting units, and projected regulatory rate base and rate base multiplier for the Gas Distribution and Storage reporting unit. The determination of fair value using the earnings multiples technique requires assumptions to be made in relation to maintainable earnings and earnings multiples for reporting units. The allocation of goodwill to held-for-sale and disposed businesses is based on the relative fair value of businesses included in the relevant reporting unit.

On April 1, 2022, we performed our annual goodwill impairment assessment which consisted of a qualitative assessment for the Liquids Pipelines, Gas Transmission and Gas Distribution and Storage reporting units and did not identify impairment indicators. Due to changes in the macroeconomic environment that has led to a rise in interest rates, we performed a quantitative assessment for the Liquids Pipelines, Gas Transmission, Gas Distribution and Storage, and Renewable Power Generation reporting units as at December 1, 2022, which resulted in the recognition of an impairment loss in Gas Transmission. Goodwill impairments were not identified in relation to the Liquids Pipelines, Gas Distribution, or Renewable Power Generation reporting units.

ASSET IMPAIRMENT

We evaluate the recoverability of our property, plant and equipment when events or circumstances such as economic obsolescence, business climate, legal or regulatory changes, or other factors indicate we may not recover the carrying amount of our assets. We regularly monitor our businesses, the market and business environments to identify indicators that could suggest an asset may not be recoverable. If it is determined that the carrying value of an asset exceeds the undiscounted cash flows expected from the asset, we will assess the fair value of the asset. An impairment loss is recognized when the carrying amount of the asset exceeds its fair value.

With respect to equity method investments, we assess at each balance sheet date whether there is objective evidence that the investment is impaired by completing a quantitative or qualitative analysis of factors impacting the investment. If there is objective evidence of impairment, we determine whether the decline below carrying value is other than temporary. If the decline is determined to be other than temporary, an impairment charge is recorded in earnings with an offsetting reduction to the carrying value of the investment.

Asset fair value is determined by quoted market prices in active markets or present value techniques. The determination of the fair value using present value techniques requires the use of projections and assumptions regarding future cash flows and weighted average cost of capital. Any changes to these projections and assumptions could result in revisions to the evaluation of the recoverability of the asset and the recognition of an impairment loss in the Consolidated Statements of Earnings.

ASSETS HELD FOR SALE

We classify assets as held for sale when management commits to a formal plan to actively market an asset or a group of assets and when management believes it is probable the sale of the assets will occur within one year. We measure assets classified as held for sale at the lower of their carrying value and their estimated fair value less costs to sell.

REGULATORY ACCOUNTING

Certain of our businesses are subject to regulation by various authorities, including but not limited to, the CER, the FERC, the Alberta Energy Regulator, La Régie de l'energie du Québec and the OEB. Regulatory bodies exercise statutory authority over matters such as construction, rates and ratemaking and agreements with customers. To recognize the economic effects of the actions of the regulator, the timing of recognition of certain revenues and expenses in these operations may differ from that otherwise expected under US GAAP for non-rate-regulated entities. Key determinants in the ratemaking process are:

- costs of providing service, including operating costs, capital invested, depreciation expense and taxes;
- allowed rate of return, including the equity component of the capital structure and related income taxes;
- interest costs on the debt component of the capital structure; and
- contract and volume throughput assumptions.

The allowed rate of return is determined in accordance with the applicable regulatory model and may impact our profitability. The rates for a number of our projects are based on a cost-of-service recovery model that follows the regulators' authoritative guidance. Under the cost-of-service tolling methodology, we calculate tolls based on forecast volumes and cost. A difference between forecast and actual results causes an over or under recovery in any given year. Regulatory assets represent amounts that are expected to be recovered from customers in future periods through rates. Regulatory liabilities represent amounts that are expected to be refunded to customers in future periods through rates or expected to be paid to cover future abandonment costs in relation to the CER's Land Matters Consultation Initiative (LMCI) and for future removal and site restoration costs as approved by the OEB.

To the extent that the regulator's actions differ from our expectations, the timing and amount of recovery or settlement of regulatory balances could differ significantly from those recorded. In the absence of rate regulation, we would generally not recognize regulatory assets or liabilities and the earnings impact would be recorded in the period the expenses are incurred or revenues are earned. A regulatory asset or liability is recognized in respect of deferred income taxes when it is expected the amounts will be recovered or settled through future regulator-approved rates.

As at December 31, 2022 and 2021, our regulatory assets totaled $6.5 billion and $5.9 billion, respectively, and regulatory liabilities totaled $3.8 billion and $3.4 billion, respectively.

DEPRECIATION

Depreciation of property, plant and equipment, our largest asset with a net book value at December 31, 2022 and 2021, of $104.5 billion and $100.1 billion, respectively, is charged in accordance with two primary methods. For distinct assets, depreciation is generally provided on a straight-line basis over the estimated useful lives of the assets commencing when the asset is placed in service. For largely homogeneous groups of assets with comparable useful lives, the pool method of accounting is followed whereby similar assets are grouped and depreciated as a pool. When group assets are retired or otherwise disposed of, gains and losses are not reflected in earnings but are booked as an adjustment to accumulated depreciation.

When it is determined that the estimated service life of an asset no longer reflects the expected remaining period of benefit, prospective changes are made to the estimated service life. Estimates of useful lives are based on third party engineering studies, experience and/or industry practice. There are a number of assumptions inherent in estimating the service lives of our assets including the level of development, exploration, drilling, reserves and production of crude oil and natural gas in the supply areas served by our pipelines as well as the demand for crude oil and natural gas and the integrity of our systems. Changes in these assumptions could result in adjustments to the estimated service lives, which could result in material changes to depreciation expense in future periods in any of our business segments. For certain rate-regulated operations, depreciation rates are approved by the regulator and the regulator may require periodic studies or technical updates on useful lives which may change depreciation rates.

PENSION AND OTHER POSTRETIREMENT BENEFITS

We use certain assumptions relating to the calculation of defined benefit pension and other postretirement liabilities and net periodic benefit costs. These assumptions comprise management's best estimates of expected return on plan assets, future salary levels, other cost escalations, retirement ages of employees and other actuarial factors including discount rates and mortality. We determine discount rates by reference to rates of high-quality long-term corporate bonds with maturities that approximate the timing of future payments anticipated to be made under each of the respective plans. The expected return on plan assets is determined using market-related values and assumptions on the asset mix consistent with the investment policy relating to the assets and their projected returns. The assumptions are reviewed annually by our independent actuaries. Actual results that differ from results based on assumptions are amortized over future periods and, therefore, could materially affect the expense recognized and the recorded obligation in future periods.

The following sensitivity analysis identifies the impact on the December 31, 2022 Consolidated Financial Statements of a 0.5% change in key pension and other postretirement benefit (OPEB) obligation assumptions:

	Canada		United States	
	Obligation	Expense	Obligation	Expense
(millions of Canadian dollars)				
Pension				
Decrease in discount rate	243	27	49	3
Decrease in expected return on assets	—	23	—	6
Decrease in rate of salary increase	(47)	(11)	(5)	(1)
OPEB				
Decrease in discount rate	13	1	5	—
Decrease in expected return on assets	N/A	N/A	—	1

CONTINGENT LIABILITIES

Provisions for claims filed against us are determined on a case-by-case basis. Case estimates are reviewed on a regular basis and are updated as new information is received. The process of evaluating claims involves the use of estimates and a high degree of management judgment. Claims outstanding, the final determination of which could have a material impact on our financial results and certain subsidiaries and investments are detailed in Part II. *Item 8. Financial Statements and Supplementary Data - Note 31. Commitments and Contingencies*. In addition, any unasserted claims that later may become evident could have a material impact on our financial results and certain subsidiaries and investments.

ASSET RETIREMENT OBLIGATIONS
Asset retirement obligations (ARO) associated with the retirement of long-lived assets are measured at fair value and recognized as Accounts payable and other or Other long-term liabilities in the period in which they can be reasonably determined. The fair value approximates the cost a third party would charge to perform the tasks necessary to retire such assets and is recognized at the present value of expected future cash flows. The discount rates used to estimate the present value of the expected future cash flows for the year ended December 31, 2022 ranged from 1.5% to 9.0% (2021 - 0.9% to 9.0%). ARO is added to the carrying value of the associated asset and depreciated over the asset's useful life. The corresponding liability is accreted over time through charges to earnings and is reduced by actual costs of decommissioning and reclamation. Our estimates of retirement costs could change as a result of changes in cost estimates and regulatory requirements. Currently, for the majority of our assets, there is insufficient data or information to reasonably determine the timing of settlement for estimating the fair value of the ARO. In these cases, the ARO cost is considered indeterminate for accounting purposes, as there is no data or information that can be derived from past practice, industry practice or the estimated economic life of the asset.

In 2009, the CER issued a decision related to the LMCI, which required holders of an authorization to operate a pipeline under the CER Act to file a proposed process and mechanism to set aside funds to pay for future abandonment costs in respect of the sites in Canada used for the operation of a pipeline. The CER's decision stated that while pipeline companies are ultimately responsible for the full costs of abandoning pipelines, abandonment costs are a legitimate cost of providing service and are recoverable from the users of the pipeline upon approval by the CER. Following the CER's final approval of the collection mechanism and the set-aside mechanism for LMCI, we began collecting and setting aside funds to cover future abandonment costs effective January 1, 2015. The funds collected are held in trust in accordance with the CER decision. The funds collected from shippers are reported within Transportation and other services revenues and Restricted long-term investments. Concurrently, we reflect the future abandonment cost as an increase to Operating and administrative expense and Other long-term liabilities.

CHANGES IN ACCOUNTING POLICIES

Refer to Part II. *Item 8. Financial Statements and Supplementary Data - Note 3. Changes in Accounting Policies*.

ITEM 7A. QUANTITATIVE AND QUALITATIVE DISCLOSURES ABOUT MARKET RISK

Our earnings, cash flows and other comprehensive income (OCI) are subject to movements in foreign exchange rates, interest rates, commodity prices and our share price.

The following summarizes the types of market risks to which we are exposed and the risk management instruments used to mitigate them. We use a combination of qualifying and non-qualifying derivative instruments to manage the risks noted below.

Foreign Exchange Risk
We generate certain revenues, incur expenses and hold a number of investments and subsidiaries that are denominated in currencies other than Canadian dollars. As a result, our earnings, cash flows and OCI are exposed to fluctuations resulting from foreign exchange rate variability.

We employ financial derivative instruments to hedge foreign currency denominated earnings exposure. A combination of qualifying cash flow, fair value and non-qualifying derivative instruments is used to hedge anticipated foreign currency denominated revenues and expenses and to manage variability in cash flows. We hedge certain net investments in US dollar-denominated investments and subsidiaries using foreign currency derivatives and US dollar-denominated debt.

Interest Rate Risk
Our earnings and cash flows are exposed to short-term interest rate variability due to the regular repricing of our variable rate debt, primarily commercial paper. We monitor our debt portfolio mix of fixed and variable rate debt instruments to manage a consolidated portfolio of floating rate debt within the Board of Directors approved policy limit of a maximum of 30% of floating rate debt as a percentage of total debt outstanding. We primarily use qualifying derivative instruments to manage interest rate risk. Pay fixed-receive floating interest rate swaps may be used to hedge against the effect of future interest rate movements. We have implemented a hedging program to partially mitigate the impact of short-term interest rate volatility on interest expense via execution of floating to fixed interest rate swaps. These hedges have an average fixed rate of 4.0%.

We are exposed to changes in the fair value of fixed rate debt that arise as a result of changes in market interest rates. Pay floating-receive fixed interest rate swaps are used, when applicable, to hedge against future changes to the fair value of fixed rate debt which mitigates the impact of fluctuations in fair value via execution of fixed to floating interest rate swaps. As at December 31, 2022, we do not have any pay floating-receive fixed interest rate swaps outstanding.

Our earnings and cash flows are also exposed to variability in longer term interest rates ahead of anticipated fixed rate term debt issuances. Forward starting interest rate swaps are used to hedge against the effect of future interest rate movements. We have established a program including some of our subsidiaries to partially mitigate our exposure to long-term interest rate variability on forecasted term debt issuances via execution of floating to fixed interest rate swaps with an average swap rate of 2.2%.

Commodity Price Risk
Our earnings and cash flows are exposed to changes in commodity prices as a result of our ownership interests in certain assets and investments, as well as through the activities of our energy services subsidiaries. These commodities include natural gas, crude oil, power and NGL. We employ financial and physical derivative instruments to fix a portion of the variable price exposures that arise from physical transactions involving these commodities. We use primarily non-qualifying derivative instruments to manage commodity price risk.

Equity Price Risk
Equity price risk is the risk of earnings fluctuations due to changes in our share price. We have exposure to our own common share price through the issuance of various forms of stock-based compensation, which affect earnings through revaluation of the outstanding units every period. We use equity derivatives to manage the earnings volatility derived from one form of stock-based compensation, restricted share units. We use a combination of qualifying and non-qualifying derivative instruments to manage equity price risk.

Market Risk Management
We have a Risk Policy to minimize the likelihood that adverse cash flow impacts arising from movements in market prices will exceed a defined risk tolerance. We identify and measure all material market risks including commodity price risks, interest rate risks, foreign exchange risk and equity price risk using a standardized measurement methodology. Our market risk metric consolidates the exposure after accounting for the impact of offsetting risks and limits the consolidated cash flow volatility arising from market related risks to an acceptable approved risk tolerance threshold. Our market risk metric is Cash Flow at Risk (CFaR).

CFaR is a statistically derived measurement used to measure the maximum cash flow loss that could potentially result from adverse market price movements over a one month holding period for price sensitive non-derivative exposures and for derivative instruments we hold or issue as recorded in the Consolidated Statements of Financial Position as at December 31, 2022. CFaR assumes that no further mitigating actions are taken to hedge or otherwise minimize exposures and the selection of a one month holding period reflects the mix of price risk sensitive assets at Enbridge. As a practical matter, a large portion of Enbridge's exposure could be hedged or unwound in a much shorter period if required to mitigate the risks.

The consolidated CFaR policy limit for Enbridge is 3.5% of its forward 12 month normalized cash flow. At December 31, 2022 and 2021 CFaR was $144 million and $103 million or 1.3% and 0.9%, respectively, of estimated 12 month forward normalized cash flow.

LIQUIDITY RISK

Liquidity risk is the risk that we will not be able to meet our financial obligations, including commitments and guarantees, as they become due. In order to mitigate this risk, we forecast cash requirements over a 12 month rolling time period to determine whether sufficient funds will be available and maintain substantial capacity under our committed bank lines of credit to address any contingencies. Our primary sources of liquidity and capital resources are funds generated from operations, the issuance of commercial paper and draws under committed credit facilities and long-term debt, which includes debentures and medium-term notes. Our shelf prospectuses with securities regulators enable ready access to either the Canadian or US public capital markets, subject to market conditions. In addition, we maintain sufficient liquidity through committed credit facilities with a diversified group of banks and institutions which, if necessary, enables us to fund all anticipated requirements for approximately one year without accessing the capital markets. We are in compliance with all the terms and conditions of our committed credit facility agreements and term debt indentures as at December 31, 2022. As a result, all credit facilities are available to us and the banks are obligated to fund us under the terms of the facilities.

CREDIT RISK

Entering into derivative instruments may result in exposure to credit risk from the possibility that a counterparty will default on its contractual obligations. In order to mitigate this risk, we enter into risk management transactions primarily with institutions that possess strong investment grade credit ratings. Credit risk relating to derivative counterparties is mitigated through maintenance and monitoring of credit exposure limits and contractual requirements, netting arrangements, and ongoing monitoring of counterparty credit exposure using external credit rating services and other analytical tools.

We generally have a policy of entering into individual International Swaps and Derivatives Association, Inc. agreements, or other similar derivative agreements, with the majority of our financial derivative counterparties. These agreements provide for the net settlement of derivative instruments outstanding with specific counterparties in the event of bankruptcy or other significant credit events and reduce our credit risk exposure on financial derivative asset positions outstanding with the counterparties in those circumstances.

FAIR VALUE MEASUREMENTS

Our financial assets and liabilities measured at fair value on a recurring basis include derivative instruments. We also disclose the fair value of other financial instruments not measured at fair value. The fair value of financial instruments reflects our best estimates of market value based on generally accepted valuation techniques or models and is supported by observable market prices and rates. When such values are not available, we use discounted cash flow analysis from applicable yield curves based on observable market inputs to estimate fair value.

ITEM 8. FINANCIAL STATEMENTS AND SUPPLEMENTARY DATA

Report of Independent Registered Public Accounting Firm

To the Shareholders and Board of Directors of Enbridge Inc.

Opinions on the Financial Statements and Internal Control over Financial Reporting

We have audited the accompanying consolidated statements of financial position of Enbridge Inc. and its subsidiaries (together, the Company) as of December 31, 2022 and 2021, and the related consolidated statements of earnings, comprehensive income, changes in equity and cash flows for each of the three years in the period ended December 31, 2022, including the related notes (collectively referred to as the consolidated financial statements). We also have audited the Company's internal control over financial reporting as of December 31, 2022, based on criteria established in *Internal Control – Integrated Framework* (2013) issued by the Committee of Sponsoring Organizations of the Treadway Commission (COSO).

In our opinion, the consolidated financial statements referred to above present fairly, in all material respects, the financial position of the Company as of December 31, 2022 and 2021, and the results of its operations and its cash flows for each of the three years in the period ended December 31, 2022 in conformity with accounting principles generally accepted in the United States of America. Also in our opinion, the Company maintained, in all material respects, effective internal control over financial reporting as of December 31, 2022, based on criteria established in *Internal Control – Integrated Framework* (2013) issued by the COSO.

Basis for Opinions

The Company's management is responsible for these consolidated financial statements, for maintaining effective internal control over financial reporting, and for its assessment of the effectiveness of internal control over financial reporting, included in Management's Annual Report on Internal Control over Financial Reporting appearing under Item 9A. Our responsibility is to express opinions on the Company's consolidated financial statements and on the Company's internal control over financial reporting based on our audits. We are a public accounting firm registered with the Public Company Accounting Oversight Board (United States) (PCAOB) and are required to be independent with respect to the Company in accordance with the U.S. federal securities laws and the applicable rules and regulations of the Securities and Exchange Commission and the PCAOB.

We conducted our audits in accordance with the standards of the PCAOB. Those standards require that we plan and perform the audits to obtain reasonable assurance about whether the consolidated financial statements are free of material misstatement, whether due to error or fraud, and whether effective internal control over financial reporting was maintained in all material respects.

Our audits of the consolidated financial statements included performing procedures to assess the risks of material misstatement of the consolidated financial statements, whether due to error or fraud, and performing procedures that respond to those risks. Such procedures included examining, on a test basis, evidence regarding the amounts and disclosures in the consolidated financial statements. Our audits also included evaluating the accounting principles used and significant estimates made by management, as well as evaluating the overall presentation of the consolidated financial statements. Our audit of internal control over financial reporting included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, and testing and evaluating the design and operating effectiveness of internal control based on the assessed risk. Our audits also included performing such other procedures as we considered necessary in the circumstances. We believe that our audits provide a reasonable basis for our opinions.

Definition and Limitations of Internal Control over Financial Reporting

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (i) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (ii) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (iii) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use, or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

Critical Audit Matters

The critical audit matter communicated below is a matter arising from the current period audit of the consolidated financial statements that was communicated or required to be communicated to the audit committee and that (i) relates to accounts or disclosures that are material to the consolidated financial statements and (ii) involved our especially challenging, subjective, or complex judgments. The communication of critical audit matters does not alter in any way our opinion on the consolidated financial statements, taken as a whole, and we are not, by communicating the critical audit matter below, providing a separate opinion on the critical audit matter or on the accounts or disclosures to which it relates.

Goodwill Impairment Assessment

As described in Notes 2 and 16 to the consolidated financial statements, the Company's goodwill balance was $32,440 million at December 31, 2022. As disclosed by management, an annual goodwill impairment assessment is performed at the reporting unit level as of April 1 of each year, or more frequently if events or circumstances indicate that the carrying value of goodwill may be impaired. Management has the option to first assess qualitative factors to determine whether it is necessary to perform the quantitative goodwill impairment assessment. In making the qualitative assessment, management considers macroeconomic trends, changes to regulatory environments, capital accessibility, operating income trends and changes to industry conditions. The quantitative goodwill impairment assessment involves determining the fair value of the Company's reporting units and comparing those values to the carrying value of each reporting unit, including goodwill. Fair value is estimated using a combination of discounted cash flow and earnings multiples techniques. The determination of fair value using the discounted cash flow technique requires the use of estimates and assumptions related to discount rates, projected operating income, expected future capital expenditures and working capital levels, as well as terminal value growth rates for the Liquids Pipelines, Gas Transmission and Midstream (Gas Transmission) and Renewable Power Generation reporting units and projected regulatory rate base and rate base multiple for the Gas Distribution and Storage (Gas Distribution) reporting unit. The determination of fair value using the earnings multiples technique requires assumptions to be made in relation to maintainable earnings and earnings multiples. Management elected to perform a qualitative goodwill impairment assessment as of April 1, 2022 for the following reporting units: Liquids Pipelines, Gas Transmission and Gas Distribution and did not identify impairment indicators. Due to changes in the macroeconomic environment that led to a rise in interest rates, management performed a quantitative assessment as of December 1, 2022 for the following reporting units: Liquids Pipelines, Gas Transmission, Gas Distribution and Renewable Power Generation. A goodwill impairment of $2,465 million was recorded in relation to the Gas Transmission reporting unit. Goodwill impairments were not identified in relation to the Liquids Pipelines, Gas Distribution or Renewable Power Generation reporting units.

The principal considerations for our determination that performing procedures relating to the goodwill impairment assessment is a critical audit matter are the significant judgments required by management when developing such significant assumptions as discount rates, projected operating income, expected future capital expenditures, terminal value growth rates, projected regulatory rate base, rate base multiple and earnings multiples used to estimate the fair value of the reporting units, as applicable, as of December 1, 2022. This led to a high degree of auditor judgment, effort and subjectivity in performing procedures to evaluate the reasonableness of management’s significant assumptions used in the quantitative assessment. In addition, the audit effort involved the use of professionals with specialized skill and knowledge.

Addressing the matter involved performing procedures and evaluating audit evidence in connection with forming our overall opinion on the consolidated financial statements. These procedures included testing the effectiveness of controls relating to management’s quantitative goodwill impairment assessment, including controls over the determination of the fair value estimates of the Company’s reporting units. These procedures also included, among others, testing management’s process for developing the fair value estimates of the Company’s reporting units. Testing management’s process for developing the fair value estimates included evaluating the appropriateness of the discounted cash flow and the earnings multiples models; testing the completeness and accuracy of underlying data used in the models; and evaluating the reasonableness of significant assumptions used by management in determining the fair value estimates including discount rates, projected operating income, expected future capital expenditures, projected regulatory rate base and rate base multiple, terminal value growth rates and earnings multiples. Assessing the reasonableness of projected operating income, expected future capital expenditures and the projected regulatory rate base involved evaluating whether these significant assumptions were reasonable considering the current and past performance of the Company’s reporting units, external industry data and evidence obtained in other areas of the audit, as applicable. Professionals with specialized skill and knowledge were used to assist in evaluating the appropriateness of management’s discounted cash flow and earnings multiples models and evaluating the reasonableness of significant assumptions used in the models, specifically discount rates, terminal value growth rates, rate base multiple and earnings multiples.

NOTES TO THE CONSOLIDATED FINANCIAL STATEMENTS
INDEX

1. BUSINESS OVERVIEW

The terms "we", "our", "us" and "Enbridge" as used in this report refer collectively to Enbridge Inc. and its subsidiaries unless the context suggests otherwise. These terms are used for convenience only and are not intended as a precise description of any separate legal entity within Enbridge.

Enbridge is a publicly traded energy transportation and distribution company. We conduct our business through five business segments: Liquids Pipelines, Gas Transmission and Midstream, Gas Distribution and Storage, Renewable Power Generation, and Energy Services. These reporting segments are strategic business units established by senior management to facilitate the achievement of our long-term objectives, to aid in resource allocation decisions and to assess operational performance.

LIQUIDS PIPELINES
Liquids Pipelines consists of pipelines and terminals in Canada and the United States (US) that transport and export various grades of crude oil and other liquid hydrocarbons, including the Mainline System, Regional Oil Sands System, Gulf Coast and Mid-Continent, and Other. This segment also includes Moda Midstream Operating, LLC (Moda), which was acquired on October 12, 2021 *(Note 8)* and is a component of Gulf Coast and Mid-Continent.

GAS TRANSMISSION AND MIDSTREAM
Gas Transmission and Midstream consists of our investments in natural gas pipelines and gathering and processing facilities in Canada and the US, including US Gas Transmission, Canadian Gas Transmission, US Midstream, and Other.

GAS DISTRIBUTION AND STORAGE
Gas Distribution and Storage consists of our natural gas utility operations, the core of which is Enbridge Gas Inc. (Enbridge Gas), which serves residential, commercial and industrial customers throughout Ontario. This business segment also includes natural gas distribution activities in Québec. We sold our investment in Noverco Inc. (Noverco), previously reported in the Gas Distribution and Storage segment, to Trencap L.P. on December 30, 2021 *(Note 13)*.

RENEWABLE POWER GENERATION
Renewable Power Generation consists primarily of investments in wind and solar assets, as well as geothermal, waste heat recovery, and transmission assets. In North America, assets are primarily located in the provinces of Alberta, Saskatchewan, Ontario and Québec, and in the states of Colorado, Texas, Indiana and West Virginia. We also have offshore wind assets in operation and under development in the United Kingdom, Germany and France. This segment also includes Tri Global Energy, LLC (TGE) which was acquired on September 27, 2022 *(Note 8).*

ENERGY SERVICES
Our Energy Services businesses in Canada and the US undertake physical commodity marketing activity and logistical services to manage our volume commitments on various pipeline systems. Energy Services also provides energy marketing services to North American refiners, producers and other customers.

ELIMINATIONS AND OTHER
In addition to the segments described above, Eliminations and Other includes operating and administrative costs that are not allocated to business segments, the impact of foreign exchange hedge settlements and the activities of our wholly-owned captive insurance subsidiaries. The principal activity of our captive insurance subsidiaries is providing insurance and reinsurance coverage for certain insurable property and casualty risk exposures of our operating subsidiaries and certain equity investments. Eliminations and Other also includes new business development activities and corporate investments.

2. SIGNIFICANT ACCOUNTING POLICIES

These consolidated financial statements are prepared in accordance with accounting principles generally accepted in the United States of America (US GAAP). Amounts are stated in Canadian dollars unless otherwise noted. As a Securities and Exchange Commission (SEC) registrant, we are permitted to use US GAAP for the purposes of meeting both our Canadian and US continuous disclosure requirements.

BASIS OF PRESENTATION AND USE OF ESTIMATES
The preparation of financial statements in conformity with US GAAP requires management to make estimates and assumptions that affect the reported amounts of assets, liabilities, revenues and expenses, as well as the disclosure of contingent assets and liabilities in the consolidated financial statements. Significant estimates and assumptions used in the preparation of the consolidated financial statements include, but are not limited to: variable consideration included in revenue *(Note 4);* carrying values of regulatory assets and liabilities *(Note 7)*; purchase price allocations *(Note 8)*; unbilled revenues; expected credit losses; depreciation rates and carrying value of property, plant and equipment *(Note 11)*; amortization rates and carrying value of intangible assets *(Note 15)*; measurement of goodwill *(Note 16)*; fair value of asset retirement obligations (ARO) *(Note 19)*; valuation of stock-based compensation *(Note 22)*; fair value of financial instruments *(Note 24)*; provisions for income taxes *(Note 25)*; assumptions used to measure retirement benefits and OPEB *(Note 26)*; commitments and contingencies *(Note 31)*; and estimates of losses related to environmental remediation obligations *(Note 31)*. Actual results could differ from these estimates.

Certain comparative figures in our consolidated financial statements have been reclassified to conform to the current year's presentation.

PRINCIPLES OF CONSOLIDATION
The consolidated financial statements include our accounts and the accounts of our subsidiaries and VIEs for which we are the primary beneficiary. A VIE is a legal entity that does not have sufficient equity at risk to finance its activities without additional subordinated financial support or is structured such that equity investors lack the ability to make significant decisions relating to the entity's operations through voting rights or do not substantively participate in the gains and losses of the entity. Upon inception of a contractual agreement, we perform an assessment to determine whether the arrangement contains a variable interest in a legal entity and whether that legal entity is a VIE. The primary beneficiary has both the power to direct the activities of the VIE that most significantly impact the entity's economic performance and the obligation to absorb losses, or the right to receive benefits from, the VIE that could potentially be significant to the VIE. Where we conclude that we are the primary beneficiary of a VIE, we consolidate the accounts of that VIE. We assess all variable interests in the entity and use our judgment when determining if we are the primary beneficiary. Other qualitative factors that are considered include decision-making responsibilities, the VIE capital structure, risk and rewards sharing, contractual agreements with the VIE, voting rights and level of involvement of other parties. We assess the primary beneficiary determination for a VIE on an ongoing basis if there are changes in the facts and circumstances related to a VIE. If an entity is determined to not be a VIE, the voting interest entity model is applied, where an investor holding the majority voting rights consolidates the entity. The consolidated financial statements also include the accounts of any limited partnerships where we represent the general partner and, based on all facts and circumstances, control such limited partnerships, unless the limited partner has substantive participating rights or substantive kick-out rights. For certain investments where we retain an undivided interest in assets and liabilities, we record our proportionate share of assets, liabilities, revenues and expenses.

All significant intercompany accounts and transactions are eliminated upon consolidation. Ownership interests in subsidiaries represented by other parties that do not control the entity are presented in the consolidated financial statements as activities and balances attributable to noncontrolling interests. Investments and entities over which we exercise significant influence are accounted for using the equity method.

REGULATION

Certain parts of our businesses are subject to regulation by various authorities including, but not limited to, the Canada Energy Regulator (CER), the Federal Energy Regulatory Commission (FERC), the Alberta Energy Regulator, the Ontario Energy Board (OEB) and la Régie de l'energie du Québec. Regulatory bodies exercise statutory authority over matters such as construction, rates and ratemaking and agreements with customers. To recognize the economic effects of the actions of the regulator, the timing of recognition of certain revenues and expenses in these operations may differ from that otherwise expected under US GAAP for non-rate-regulated entities.

Regulatory assets represent amounts that are expected to be recovered from customers in future periods through rates. Regulatory liabilities represent amounts that are expected to be refunded to customers in future periods through rates or to be paid to cover future abandonment costs in relation to the CER's Land Matters Consultation Initiative (LMCI). Regulatory assets are assessed for impairment if we identify an event indicative of possible impairment. The recognition of regulatory assets and liabilities is based on the actions, or expected future actions, of the regulator. To the extent that the regulator's actions differ from our expectations, the timing and amount of recovery or settlement of regulatory balances could differ significantly from those recorded. In the absence of rate regulation, we would generally not recognize regulatory assets or liabilities and the earnings impact would be recorded in the period the expenses are incurred or revenues are earned. A regulatory asset or liability is recognized in respect of deferred income taxes when it is expected the amounts will be recovered or settled through future regulator-approved rates. We believe that the recovery of our regulatory assets as at December 31, 2022 is probable over the periods described in *Note 7 - Regulatory Matters*.

Allowance for funds used during construction (AFUDC) is included in the cost of property, plant and equipment and is depreciated over future periods as part of the total cost of the related asset. AFUDC includes both an interest component and, if approved by the regulator, a cost of equity component, which are both capitalized based on rates set out in a regulatory agreement. The corresponding impact on earnings is included in Interest expense for the interest component and Other income/(expense) for the equity component. In the absence of rate regulation, we would capitalize interest using a capitalization rate based on our cost of borrowing, whereas the capitalized equity component, the corresponding earnings during the construction phase and the subsequent depreciation relating to the equity component would not be recognized. The equity component of AFUDC is included as a non-cash reconciling item to earnings within Cash Flows from Operating Activities in the Consolidated Statements of Cash Flows.

Under the pool method prescribed by certain regulators, it is not possible to identify the carrying value of the equity component of AFUDC or its effect on depreciation. Similarly, gains and losses on the retirement of certain specific fixed assets in any given year cannot be identified or quantified.

With the approval of regulators, certain operations capitalize a percentage of specified operating costs. These operations are authorized to charge depreciation and earn a return on the net book value of such capitalized costs in future years. In the absence of rate regulation, a portion of such operating costs would be charged to earnings in the year incurred.

For certain regulated operations to which US GAAP guidance for phase-in plans applies, negotiated depreciation rates recovered in transportation tolls may be less than the depreciation expense calculated in accordance with US GAAP in early years of long-term contracts but recovered in future periods when tolls exceed depreciation. Depreciation expense on such assets is recorded in accordance with US GAAP and no regulatory asset is recorded.

REVENUE RECOGNITION

For businesses that are not rate-regulated, revenues are recorded when products have been delivered or services have been performed, the amount of revenue can be reliably measured and collectability is reasonably assured. Customer creditworthiness is assessed prior to agreement signing, as well as throughout the contract duration. Certain revenues from our liquids and natural gas pipeline businesses are recognized under the terms of committed delivery contracts, rather than the cash tolls received.

Long-term take-or-pay contracts, under which shippers are obligated to pay fixed amounts ratably over the contract period regardless of volumes shipped, may contain make-up rights. Make-up rights are earned by shippers when minimum volume commitments are not utilized during the period but under certain circumstances can be used to offset overages in future periods, subject to expiry. We recognize revenues associated with make-up rights at the earlier of when the make-up volume is shipped, the make-up right expires or when it is determined that the likelihood that the shipper will utilize the make-up right is remote. We also have long-term contracts where the revenue profile does not align with the cash receipt schedule, resulting in the recognition of deferred revenue.

Certain offshore pipeline transportation contracts require us to provide transportation services for the life of the underlying producing fields. Under these arrangements, shippers pay us a fixed monthly toll for a defined period of time which may be shorter than the estimated reserve life of the underlying producing fields, resulting in a contract period which extends past the period of cash collection. Fixed monthly toll revenues are recognized ratably over the committed volume made available to shippers throughout the contract period, regardless of when cash is received.

For the years ended December 31, 2022, 2021 and 2020, cash received net of revenue recognized for contracts under make-up rights and similar deferred revenue arrangements was $238 million, $127 million and $292 million, respectively.

For rate-regulated businesses, revenues are recognized in a manner that is consistent with the underlying agreements as approved by the regulators. Natural gas utility revenues are recorded based on regular meter readings and estimates of customer usage from the last meter reading to the end of the reporting period. Estimates are based on historical consumption patterns and heating degree days experienced. Heating degree days is a measure of coldness that is indicative of volumetric requirements for natural gas utilized for heating purposes in our distribution franchise areas.

Our Energy Services segment enters into commodity purchase and sale arrangements that are recorded on a gross basis as the related contracts are not held for trading purposes and we are acting as the principal in the transactions.

No non-affiliated customer exceeded 10.0% of our third-party revenues for the year ended December 31, 2022. Our largest non-affiliated customer accounted for approximately 13.5% and 13.6% of our third-party revenues for the years ended December 31, 2021 and 2020, respectively.

DERIVATIVE INSTRUMENTS AND HEDGING

Non-qualifying Derivatives

Non-qualifying derivative instruments are used primarily to economically hedge foreign exchange, interest rate and commodity price earnings exposure. Non-qualifying derivatives are measured at fair value with changes in fair value recognized in earnings in Commodity sales, Transportation and other services revenue, Commodity costs, Operating and administrative expense, Other income/(expense) and Interest expense.

Derivatives in Qualifying Hedging Relationships
We use derivative financial instruments to manage our exposure to changes in commodity prices, foreign exchange rates, interest rates and certain compensation tied to our share price. Hedge accounting is optional and requires us to document the hedging relationship and test the hedging item's effectiveness in offsetting changes in fair values or cash flows of the underlying hedged item on an ongoing basis. We present the earnings effects of hedging items with the hedged transaction. Derivatives in qualifying hedging relationships are categorized as cash flow hedges, fair value hedges or net investment hedges.

Cash Flow Hedges
We use cash flow hedges to manage our exposure to changes in commodity prices, foreign exchange rates, interest rates and certain compensation tied to our share price. The change in the fair value of a cash flow hedging instrument is recorded in Other comprehensive income/(loss) (OCI) and is reclassified to earnings when the hedged item impacts earnings.

If a derivative instrument designated as a cash flow hedge ceases to be effective or is terminated, hedge accounting is discontinued and the gain or loss at that date is deferred in OCI and recognized in earnings concurrently with the related transaction. If an anticipated hedged transaction is no longer probable, the gain or loss is recognized immediately in earnings. Subsequent gains and losses from derivative instruments for which hedge accounting has been discontinued are recognized in earnings in the period in which they occur.

Fair Value Hedges
We may use fair value hedges to hedge the fair value of debt instruments. The change in the fair value of the hedging instrument is recorded in earnings with changes in the fair value of the hedged risk of the asset or liability that is designated as part of the hedging relationship. If a fair value hedge is discontinued or ceases to be effective, the hedged risk of the asset or liability ceases to be remeasured at fair value and the cumulative fair value adjustment to the carrying value of the hedged item is recognized in earnings over the remaining life of the hedged item.

Net Investment Hedges
Gains and losses arising from the translation of our net investment in foreign operations from their functional currencies to Enbridge's Canadian dollar presentation currency are included in cumulative translation adjustments (CTA), a component of OCI. We currently have designated a portion of our US dollar-denominated debt, as well as a portfolio of foreign exchange forward contracts in prior periods, as a hedge of our net investment in US dollar-denominated investments and subsidiaries. As a result, the change in fair value of the foreign currency derivatives, as well as the translation of US dollar-denominated debt, are reflected in OCI. Amounts recognized previously in Accumulated other comprehensive income/(loss) (AOCI) are reclassified to earnings when there is a reduction of the hedged net investment resulting from the disposal of a foreign operation.

Classification of Derivatives
We recognize the fair value of derivative instruments in the Consolidated Statements of Financial Position as current and non-current assets or liabilities depending on the timing of settlements and the resulting cash flows associated with the instruments. Fair value amounts related to cash flows occurring beyond one year are classified as non-current.

Cash inflows and outflows related to derivative instruments are classified as Cash Flows from Operating Activities in the Consolidated Statements of Cash Flows.

Balance Sheet Offset
Assets and liabilities arising from derivative instruments may be offset in the Consolidated Statements of Financial Position when we have the legal right and intention to settle them on a net basis.

Transaction Costs
Transaction costs are incremental costs directly related to the acquisition of a financial asset or the issuance of a financial liability. We incur transaction costs primarily from the issuance of debt and account for these costs as a reduction to Long-term debt in the Consolidated Statements of Financial Position. These costs are amortized using the effective interest rate method over the term of the related debt instrument and are recorded in Interest expense.

EQUITY INVESTMENTS
Equity investments over which we exercise significant influence, but do not have controlling financial interests, are accounted for using the equity method. These investments are initially measured at cost and are adjusted for our proportionate share of undistributed equity earnings or loss. Our equity investments are increased for contributions made to, and decreased for distributions received from, the investee. To the extent an equity investee undertakes activities necessary to commence its planned principal operations, we capitalize interest costs associated with the investment during such period.

RESTRICTED LONG-TERM INVESTMENTS
Long-term investments that are restricted as to withdrawal or usage for the purposes of the CER's LMCI are presented as Restricted long-term investments in the Consolidated Statements of Financial Position.

OTHER INVESTMENTS
Generally, we classify equity investments in entities over which we do not exercise significant influence and that do not have readily determinable fair values as other investments measured using the fair value measurement alternative (FVMA). These investments are recorded at cost less impairment, if any, and adjusted for the impact of observable price changes occurring in orderly transactions for an identical or similar investment of the same issuer. Investments in equity securities measured using the FVMA are reviewed for impairment each reporting period and written down to their fair value if objective evidence of impairment is identified. Equity investments with readily determinable fair values are measured at fair value through earnings. Dividends received from investments in equity securities are recognized in earnings when the right to receive payment is established.

Investments in debt securities are classified as available-for-sale and measured at fair value through OCI.

NONCONTROLLING INTERESTS
Noncontrolling interests represent ownership interests attributable to third parties in certain consolidated subsidiaries. The portion of equity not owned by us in such entities is reflected as Noncontrolling interests within the equity section of the Consolidated Statements of Financial Position.

INCOME TAXES
Income taxes are accounted for using the liability method. Deferred income tax assets and liabilities are recorded based on temporary differences between the tax bases of assets and liabilities and their carrying values for accounting purposes. Deferred income tax assets and liabilities are measured using the tax rate that is expected to apply when the temporary differences reverse. For our regulated operations, a deferred income tax liability or asset is recognized with a corresponding regulatory asset or liability, respectively, to the extent that taxes can be recovered through rates. Any interest and/or penalty incurred related to tax is reflected in Income tax expense.

FOREIGN CURRENCY TRANSACTIONS AND TRANSLATION
Foreign currency transactions are those transactions whose terms are denominated in a currency other than the currency of the primary economic environment in which Enbridge or a reporting subsidiary operates, referred to as the functional currency. Transactions denominated in foreign currencies are translated to the functional currency using the exchange rate prevailing at the date of the transaction. Monetary assets and liabilities denominated in foreign currencies are translated to the functional currency using the exchange rate in effect as at the balance sheet date. Exchange gains and losses resulting from the translation of monetary assets and liabilities are included in earnings in the period in which they arise.

Gains and losses arising from the translation of foreign operations' functional currencies to our Canadian dollar presentation currency are included in the CTA component of AOCI and are recognized in earnings upon sale of the foreign operation. Asset and liability accounts are translated at the exchange rates in effect as at the balance sheet date, while revenues and expenses are translated using monthly average exchange rates.

CASH AND CASH EQUIVALENTS
Cash and cash equivalents include short-term investments with a term to maturity of three months or less when purchased.

RESTRICTED CASH
Cash and cash equivalents that are restricted as to withdrawal or usage for the purposes of the CER's LMCI or in accordance with specific commercial arrangements are presented as Restricted cash in the Consolidated Statements of Financial Position.

LOANS AND RECEIVABLES
Long-term notes receivable from affiliates are measured at amortized cost using the effective interest rate method, net of any impairment losses recognized. Accounts receivable and other are measured at cost. Interest income is recognized in earnings as it is earned with the passage of time.

CURRENT EXPECTED CREDIT LOSSES
For accounts receivable, a loss allowance matrix is utilized to measure lifetime expected credit losses. The matrix contemplates historical credit losses by age of receivables, adjusted for any forward-looking information and management expectations. Other loan receivables and applicable off-balance sheet commitments utilize a discounted cash flow methodology which calculates the current expected credit losses based on historical default probability rates associated with the credit rating of the counterparty and the related term of the loan or commitment, adjusted for forward-looking information and management expectations.

NATURAL GAS IMBALANCES
The Consolidated Statements of Financial Position include balances as a result of differences in gas volumes received from, and delivered for, customers. As settlement of certain imbalances is in-kind, changes in the balances do not have an effect on our Consolidated Statements of Earnings or Consolidated Statements of Cash Flows. Most natural gas volumes owed to or by us are valued at natural gas market index prices as at the balance sheet dates.

INVENTORY
Inventory is comprised of natural gas held in storage by Enbridge Gas, crude oil and natural gas held primarily by businesses in the Energy Services segment and materials and supplies. Natural gas held in storage by Enbridge Gas is recorded at the quarterly prices approved by the OEB in the determination of distribution rates. The actual price of gas purchased may differ from the OEB approved price. The difference between the approved price and the actual cost of gas purchased is deferred as a liability for future refund, or as an asset for collection, as approved by the OEB. Other inventory is recorded at the lower of cost, as determined on a weighted average basis, or market value. Upon disposition, other commodities inventory is recorded to Commodity costs in the Consolidated Statements of Earnings at the weighted average cost of inventory, including any adjustments recorded to reduce inventory to market value. Materials and supplies inventory is recorded at the lower of average cost or net realizable value.

PROPERTY, PLANT AND EQUIPMENT

Property, plant and equipment is recorded at historical cost. Expenditures for construction, expansion, major renewals and betterments are capitalized. Maintenance and repair costs are expensed as incurred. Expenditures for project development are capitalized if they are expected to have future benefit. We capitalize interest incurred during construction for non-rate-regulated assets. For rate-regulated assets, AFUDC is included in the cost of property, plant and equipment and is depreciated over future periods as part of the total cost of the related asset.

Two primary methods of depreciation are utilized. For distinct assets, depreciation is generally provided on a straight-line basis over the estimated useful lives of the assets commencing when the asset is placed in service. For largely homogeneous groups of assets with comparable useful lives, the pool method of accounting for property, plant and equipment is followed whereby similar assets are grouped and depreciated as a pool. When group assets are retired or otherwise disposed of, gains and losses are generally not reflected in earnings but are booked as an adjustment to accumulated depreciation.

LEASES

We recognize an arrangement as a lease when a customer has the right to obtain substantially all of the economic benefits from the use of an asset, as well as the right to direct the use of the asset. We recognize right-of-use (ROU) assets and the related lease liabilities in the Consolidated Statements of Financial Position for operating lease arrangements with a term of 12 months or longer. We do not separate non-lease components from the associated lease components of our lessee contracts and account for both components as a single lease component. We combine lease and non-lease components within a contract for operating lessor leases when certain conditions are met. ROU assets are assessed for impairment using the same approach applied for other long-lived assets.

Lease liabilities and ROU assets require the use of judgment and estimates which are applied in determining the term of a lease, appropriate discount rates, whether an arrangement contains a lease, whether there are any indicators of impairment for ROU assets and whether any ROU assets should be grouped with other long-lived assets for impairment testing.

DEFERRED AMOUNTS AND OTHER ASSETS

Deferred amounts and other assets primarily consists of costs that regulatory authorities have permitted, or are expected to permit, to be recovered through future rates, including: deferred income taxes; the fair value adjustment to long-term debt; actual cost of removal of previously retired or decommissioned plant assets; the difference between the actual cost and approved cost of natural gas reflected in rates; and actuarial gains and losses arising from defined benefit pension plans.

INTANGIBLE ASSETS

Intangible assets consist primarily of certain software costs, customer relationships and emission allowances. We capitalize costs incurred during the application development stage of internal use software projects. Customer relationships represent the underlying relationship from long-term agreements with customers that are capitalized upon acquisition. Intangible assets are generally amortized on a straight-line basis over their expected lives, commencing when the asset is available for use, with the exception of emission allowances, which are not amortized as they will be used to satisfy compliance obligations as they come due.

GOODWILL

Goodwill represents the excess of the purchase price over the fair value of net identifiable assets upon acquisition of a business. The carrying value of goodwill, which is not amortized, is assessed for impairment annually or more frequently if events or changes in circumstances arise that suggest the carrying value of goodwill may be impaired. We perform our annual review of the goodwill balance on April 1.

We perform our annual review for impairment at the reporting unit level, which is identified by assessing whether the components of our operating segments constitute businesses for which discrete information is available, whether segment management regularly reviews the operating results of those components, and whether the economic and regulatory characteristics are similar. Our reporting units are Liquids Pipelines, Gas Transmission, Gas Distribution and Storage, and Renewable Power Generation. The Renewable Power Generation reporting unit had goodwill beginning in the third quarter of 2022.

We have the option to first assess qualitative factors to determine whether it is necessary to perform the quantitative goodwill impairment assessment. When performing a qualitative assessment, we determine the drivers of fair value for each reporting unit and evaluate whether those drivers have been positively or negatively affected by relevant events and circumstances since the last fair value assessment. Our evaluation includes, but is not limited to, the assessment of macroeconomic trends, changes to regulatory environments, capital accessibility, operating income trends and changes to industry conditions. Based on our assessment of qualitative factors, if we determine it is more likely than not that the fair value of the reporting unit is less than its carrying amount, a quantitative goodwill impairment assessment is performed.

The quantitative goodwill impairment assessment involves determining the fair value of our reporting units and comparing those values to the carrying value of each reporting unit. If the carrying value of a reporting unit, including allocated goodwill, exceeds its fair value, goodwill impairment is measured at the amount by which the reporting unit’s carrying value exceeds its fair value. This amount should not exceed the carrying amount of goodwill. The fair value of our reporting units is estimated using a combination of discounted cash flow and earnings multiples techniques. The determination of fair value using the discounted cash flow technique requires the use of estimates and assumptions related to discount rates, projected operating income, expected future capital expenditures and working capital levels, as well as terminal value growth rates for the Liquids Pipelines, Gas Transmission and Renewable Power Generation reporting units, and projected regulatory rate base and rate base multiple for the Gas Distribution and Storage reporting unit. The determination of fair value using the earnings multiples technique requires assumptions to be made in relation to maintainable earnings and earnings multiples for reporting units.

The allocation of goodwill to held-for-sale and disposed businesses is based on the relative fair value of businesses included in the relevant reporting unit.

On April 1, 2022, we performed our annual goodwill impairment assessment which consisted of a qualitative assessment for the Liquids Pipelines, Gas Transmission and Gas Distribution and Storage reporting units and did not identify impairment indicators. Due to changes in the macroeconomic environment that have led to a rise in interest rates, we performed a quantitative assessment for the Liquids Pipelines, Gas Transmission, Gas Distribution and Storage, and Renewable Power Generation reporting units as at December 1, 2022, which resulted in the recognition of an impairment loss for Gas Transmission *(Note 16)*. Goodwill impairments were not identified in relation to the Liquids Pipelines, Gas Distribution and Storage or Renewable Power Generation reporting units. Also, we did not identify any indicators of goodwill impairment during the remainder of 2022.

IMPAIRMENT

We review the carrying values of our long-lived assets as events or changes in circumstances warrant. If it is determined that the carrying value of an asset exceeds its expected undiscounted cash flows, we will calculate fair value based on the discounted cash flows and write the asset down to the extent that the carrying value exceeds the fair value.

With respect to investments in debt securities and equity investments, we assess at each balance sheet date whether there is objective evidence that a financial asset is impaired by completing a quantitative or qualitative analysis of factors impacting the investment. If there is objective evidence of impairment, we value the expected discounted cash flows using observable market inputs. We determine whether the decline below carrying value is other-than-temporary for equity method investments or is due to a credit loss for investments in debt securities. If the decline is determined to be other-than-temporary for equity method investments or is due to a credit loss for investments in debt securities, an impairment charge is recorded in earnings with an offsetting reduction to the carrying value of the asset.

ASSET RETIREMENT OBLIGATIONS
ARO associated with the retirement of long-lived assets are measured at fair value and recognized as Accounts payable and other or Other long-term liabilities in the period in which they can be reasonably determined. Fair value approximates the cost a third party would charge to perform the tasks necessary to retire such assets and is recognized at the present value of expected future cash flows. ARO are added to the carrying value of the associated asset and depreciated over the asset's useful life. The corresponding liability is accreted over time through charges to earnings and is reduced by actual costs of decommissioning and reclamation. Our estimates of retirement costs could change as a result of changes in cost estimates and regulatory requirements. Currently, for the majority of our assets, it is not possible to make a reasonable estimate of ARO due to the indeterminate timing and scope of the asset retirements.

PENSION AND OTHER POSTRETIREMENT BENEFITS
We sponsor defined benefit and defined contribution pension plans, as well as defined benefit OPEB plans.

Obligations and net periodic benefit costs for defined benefit pension and OPEB plans are estimated using the projected unit credit method, which is based on years of service, as well as our best estimates of actuarial assumptions such as discount rates, future salary levels, other cost escalations, employees' retirement ages, and mortality.

We determine discount rates using market yields of high-quality corporate bonds with maturities that approximate the estimated timing of future benefit payments.

Plan assets are measured at fair value. The expected return on plan assets is determined using the long-term target asset mixes in our investment policies and long-term market expectations.

Actuarial gains and losses arise from the difference between the actual and expected return on plan assets, and changes in actuarial assumptions such as discount rates. Periodic net actuarial gains and losses and prior service costs are accumulated and presented as follows in the Consolidated Statements of Financial Position:

- as a component of AOCI, for our non-utilities' defined benefit pension plans and all defined benefit OPEB plans; and
- as a component of Deferred amounts and other assets and/or Other long-term liabilities, for our utilities' defined benefit pension plans, to the extent that the net actuarial gains and losses and prior service costs have been permitted or are expected to be permitted by the regulators, to be recovered through future rates.

Net periodic benefit cost is recognized in earnings and includes:

- current service cost;
- interest cost;
- expected return on plan assets;
- amortization of prior service costs over the expected average remaining service life of the plans' active employee group; and
- amortization of net actuarial gains and losses in excess of 10% of the greater of the benefit obligation or the fair value of plan assets, over the expected average remaining service life of the plans' active employee group.

Our utility operations also record regulatory adjustments for the difference between net periodic benefit costs for accounting versus ratemaking purposes. Offsetting regulatory assets or liabilities are recorded to the extent net periodic benefit costs are expected to be recovered from or refunded to customers, respectively, in future rates. In the absence of rate regulation, regulatory assets or liabilities would not be recorded and net periodic benefit costs would be charged to earnings and OCI on an accrual basis.

For defined contribution plans, our contributions are expensed when the contribution occurs.

STOCK-BASED COMPENSATION

Incentive Stock Options (ISO) granted are recorded using the fair value method. Under this method, compensation expense is measured at the grant date based on the fair value of the ISO granted as calculated by the Black-Scholes-Merton model and is recognized on a straight-line basis over the shorter of the vesting period or the period to early retirement eligibility, with a corresponding credit to Additional paid-in capital. Balances in Additional paid-in capital are transferred to Share capital when the options are exercised.

Performance Stock Units (PSU) and Restricted Stock Units (RSU) are cash settled awards for which the related liability is remeasured each reporting period. PSUs vest at the completion of a three-year term and RSUs vest one-third annually from the grant date. During the vesting term, compensation expense is recorded based on the number of units outstanding and the current market price of Enbridge’s common shares with an offset to Accounts payable and other or Other long-term liabilities. The value of the PSUs is also dependent on our performance relative to performance targets set out under the plan. We also award share settled RSUs which vest at the completion of a three-year term. During the vesting term, compensation expense is recorded based on the number of units granted and the market price of Enbridge's common shares on the day immediately preceding the grant date, with an offset to Additional paid-in capital.

COMMITMENTS, CONTINGENCIES AND ENVIRONMENTAL LIABILITIES
We expense or capitalize, as appropriate, expenditures for ongoing compliance with environmental regulations that relate to past or current operations. We expense costs incurred for remediation of existing environmental contamination caused by past operations that do not benefit future periods by preventing or eliminating future contamination. We record liabilities for environmental matters when assessments indicate that remediation efforts are probable and the costs can be reasonably estimated. Estimates of environmental liabilities are based on currently available facts, existing technology and presently enacted laws and regulations, taking into consideration the likely effects of inflation and other factors. These amounts also consider prior experience in remediating contaminated sites, other companies' clean-up experience and data released by government organizations. Our estimates are subject to revision in future periods based on actual costs or new information and are included in Accounts payable and other and Other long-term liabilities in the Consolidated Statements of Financial Position at their undiscounted amounts. There is always a potential of incurring additional costs in connection with environmental liabilities due to variations in any or all of the categories described above, including modified or revised requirements from regulatory agencies, in addition to fines and penalties, as well as expenditures associated with litigation and settlement of claims. We evaluate recoveries from insurance coverage separately from the liability and, when recovery is probable, we record and report an asset separately from the associated liability in the Consolidated Statements of Financial Position.

Liabilities for other commitments and contingencies are recognized when, after fully analyzing available information, we determine it is either probable that an asset has been impaired or that a liability has been incurred, and the amount of impairment or loss can be reasonably estimated. When a range of probable loss can be estimated, we recognize the most likely amount, or if no amount is more likely than another, the minimum of the range of probable loss is accrued. We expense legal costs associated with loss contingencies as such costs are incurred.

3. CHANGES IN ACCOUNTING POLICIES

CHANGES IN ACCOUNTING POLICIES
There were no changes in accounting policies during the year ended December 31, 2022.

ADOPTION OF NEW ACCOUNTING STANDARDS
Disclosures About Government Assistance
Effective January 1, 2022, we adopted Accounting Standards Update (ASU) 2021-10 on a prospective basis. The new standard was issued in November 2021 to increase the transparency of government assistance to business entities. The ASU adds new disclosure requirements for transactions with governments that are accounted for using a grant or contribution accounting model by analogy. The required disclosures include information about the nature of transactions, accounting policy applied, impacted financial statement line items and significant terms and conditions. The adoption of this ASU did not have a material impact on our consolidated financial statements.

Accounting for Certain Lessor Leases with Variable Lease Payments
Effective January 1, 2022, we adopted ASU 2021-05 on a prospective basis. The new standard was issued in July 2021 to amend lessor accounting for certain leases with variable lease payments that do not depend on a reference index or a rate and would have resulted in the recognition of a loss at lease commencement if classified as a sales-type or a direct financing lease. The ASU amends the classification requirements of such leases for lessors to result in an operating lease classification. The adoption of this ASU did not have a material impact on our consolidated financial statements.

Accounting for Modifications or Exchanges of Certain Equity-Classified Contracts
Effective January 1, 2022, we adopted ASU 2021-04 on a prospective basis. The new standard was issued in May 2021 to clarify issuer accounting for modifications or exchanges of freestanding equity-classified written call options that remain equity classified after modification or exchange. The ASU requires an issuer to determine the accounting for the modification or exchange based on the economic substance of the modification or exchange. The adoption of this ASU did not have a material impact on our consolidated financial statements.

Accounting for Convertible Instruments and Contracts in an Entity's Own Equity
Effective January 1, 2022, we adopted ASU 2020-06 on a modified retrospective basis. The new standard was issued in August 2020 to simplify accounting for certain financial instruments. The ASU eliminates the current models that require separation of beneficial conversion and cash conversion features from convertible instruments and simplifies the derivative scope exception guidance pertaining to equity classification of contracts in an entity's own equity. The ASU also introduces additional disclosures for convertible debt and freestanding instruments that are indexed to and settled in an entity's own equity. The ASU amends the diluted earnings per share guidance, including the requirement to use if-converted method for all convertible instruments and an update for instruments that can be settled in either cash or shares. The adoption of this ASU did not have a material impact on our consolidated financial statements.

4. REVENUE

REVENUE FROM CONTRACTS WITH CUSTOMERS
Major Products and Services

Year ended December 31, 2022	Liquids Pipelines	Gas Transmission and Midstream	Gas Distribution and Storage	Renewable Power Generation	Energy Services	Eliminations and Other	Consolidated

1 *Includes mark-to-market losses from our hedging program for the year ended December 31, 2022 of $431 million (2021 - $59 million gain; 2020 - $265 million gain).*
2 *Includes revenues from lease contracts. Refer to* Note 27 - Leases.

We disaggregate revenue into categories which represent our principal performance obligations within each business segment. These revenue categories represent the most significant revenue streams in each segment and consequently are considered to be the most relevant revenue information for management to consider in evaluating performance.

Contract Balances

	Contract Receivables	Contract Assets	Contract Liabilities
(millions of Canadian dollars)			
Balance as at December 31, 2022	**3,183**	**230**	**2,241**
Balance as at December 31, 2021	2,369	213	1,898

Contract receivables represent the amount of receivables derived from contracts with customers.

Contract assets represent the amount of revenue which has been recognized in advance of payments received for performance obligations we have fulfilled (or have partially fulfilled) and prior to the point in time at which our right to the payment is unconditional. Amounts included in contract assets are transferred to accounts receivable when our right to the consideration becomes unconditional.

Contract liabilities represent payments received for performance obligations which have not been fulfilled. Contract liabilities primarily relate to make-up rights and deferred revenue. Revenue recognized during the year ended December 31, 2022 included in contract liabilities at the beginning of the year is $166 million. Increases in contract liabilities from cash received, net of amounts recognized as revenue during the year ended December 31, 2022, were $453 million.

Performance Obligations

Segment	Nature of Performance Obligation
Liquids Pipelines	• Transportation and storage of crude oil and natural gas liquids (NGL)
Gas Transmission and Midstream	• Transportation, storage, gathering, compression and treating of natural gas • Transportation of NGL • Sale of crude oil, natural gas and NGL
Gas Distribution and Storage	• Supply and delivery of natural gas • Transportation of natural gas • Storage of natural gas
Renewable Power Generation	• Generation and transmission of electricity • Delivery of electricity from renewable energy generation facilities

There was no material revenue recognized during the year ended December 31, 2022 from performance obligations satisfied in previous periods.

Payment Terms

Payments are received monthly from customers under long-term transportation, commodity sales, and gas gathering and processing contracts. Payments from Gas Distribution and Storage customers are received on a continuous basis based on established billing cycles.

Certain contracts in our US offshore business provide for us to receive a series of fixed monthly payments (FMPs) for a specified period that is less than the period during which the performance obligations are satisfied. As a result, a portion of the FMPs are recorded as contract liabilities. The FMPs are not considered to be a financing arrangement as payments are scheduled to match the production profiles of offshore oil and gas fields, which generate greater revenue in the initial years of their productive lives.

Revenue to be Recognized from Unfulfilled Performance Obligations
Total revenue from performance obligations expected to be fulfilled in future periods is $58.6 billion, of which $7.6 billion is expected to be recognized during the year ending December 31, 2023.

The revenues excluded from the amounts above based on optional exemptions available under Accounting Standards Codification (ASC) 606, as explained below, represent a significant portion of our overall revenues and revenues from contracts with customers. Certain revenues such as flow-through operating costs charged to shippers are recognized at the amount for which we have the right to invoice our customers and are excluded from the amounts of revenue to be recognized in the future from unfulfilled performance obligations above. Variable consideration is excluded from the amounts above due to the uncertainty of the associated consideration, which is generally resolved when actual volumes and prices are determined. For example, we consider interruptible transportation service revenues to be variable revenues since volumes cannot be estimated. Additionally, the effect of escalation on certain tolls which are contractually escalated for inflation has not been reflected in the amounts above as it is not possible to reliably estimate future inflation rates. Revenues for periods extending beyond the current rate settlement term for regulated contracts where the tolls are periodically reset by the regulator are excluded from the amounts above since future tolls remain unknown. Finally, revenues from contracts with customers which have an original expected duration of one year or less are excluded from the amounts above.

SIGNIFICANT JUDGMENTS MADE IN RECOGNIZING REVENUE
Long-Term Transportation Agreements
For long-term transportation agreements, significant judgments pertain to the period over which revenue is recognized and whether the agreement provides for make-up rights for the shippers. Transportation revenue earned from firm contracted capacity arrangements is recognized ratably over the contract period. Transportation revenue from interruptible or volumetric-based arrangements is recognized when services are performed.

Variable Consideration
Revenue from arrangements subject to variable consideration is recognized only to the extent that it is probable that a significant reversal in the amount of cumulative revenue recognized will not occur when the uncertainty associated with the variable consideration is subsequently resolved. Uncertainties associated with variable consideration relate principally to differences between estimated and actual volumes and prices. These uncertainties are resolved each month when actual volumes are sold or transported and actual tolls and prices are determined.

During the year ended December 31, 2022, revenue for the Canadian Mainline has been recognized in accordance with the terms of the Competitive Toll Settlement (CTS), which expired on June 30, 2021. The tolls in place on June 30, 2021 continue on an interim basis until a new commercial arrangement is implemented and are subject to finalization and adjustment applicable to the interim period, if any. Due to the uncertainty of adjustment to tolling pursuant to a CER decision and potential customer negotiations, interim toll revenue recognized during the year ended December 31, 2022 is considered variable consideration.

Recognition and Measurement of Revenue

Year ended December 31, 2022	Liquids Pipelines	Gas Transmission and Midstream	Gas Distribution and Storage	Renewable Power Generation	Consolidated
(millions of Canadian dollars)					
Revenue from products transferred at a point in time	**—**	**—**	**127**	**—**	**127**

Year ended December 31, 2020	Liquids Pipelines	Gas Transmission and Midstream	Gas Distribution and Storage	Renewable Power Generation	Consolidated
(millions of Canadian dollars)					
Revenue from products transferred at a point in time	—	—	60	—	60
Revenue from products and services transferred over time[1]	9,255	4,824	4,480	198	18,757
Total revenue from contracts with customers	9,255	4,824	4,540	198	18,817

1 Revenue from crude oil and natural gas pipeline transportation, storage, natural gas gathering, compression and treating, natural gas distribution, natural gas storage services and electricity sales.

Performance Obligations Satisfied Over Time
For arrangements involving the transportation and sale of petroleum products and natural gas where the transportation services or commodities are simultaneously received and consumed by the shipper or customer, we recognize revenue over time using an output method based on volumes of commodities delivered or transported. The measurement of the volumes transported or delivered corresponds directly to the benefits received by the shippers or customers during that period.

Determination of Transaction Prices
Prices for transportation and gas processing services are determined based on the capital cost of the facilities, pipelines and associated infrastructure required to provide such services, plus a rate of return on capital invested that is determined either through negotiations with customers or through regulatory processes for those operations that are subject to rate regulation.

Prices for commodities sold are determined by reference to market price indices, plus or minus a negotiated differential and in certain cases a marketing fee.

Prices for natural gas sold and distribution services provided by regulated natural gas distribution operations are prescribed by regulation.

5. SEGMENTED INFORMATION

Segmented information for the years ended December 31, 2022, 2021 and 2020 is as follows:

The measurement basis for preparation of segmented information is consistent with the significant accounting policies *(Note 2)*.

GEOGRAPHIC INFORMATION
Revenues[1]

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Canada	**27,498**	20,474	16,453
US	**25,811**	26,597	22,634
	53,309	47,071	39,087

1 Revenues are based on the country of origin of the product or service sold.

Property, Plant and Equipment[1]

December 31,	**2022**	2021
(millions of Canadian dollars)		
Canada	**47,602**	47,102
US	**56,858**	52,965
	104,460	100,067

1 Amounts are based on the location where the assets are held.

6. EARNINGS PER COMMON SHARE

BASIC
Earnings per common share is calculated by dividing earnings attributable to common shareholders by the weighted average number of common shares outstanding. On December 30, 2021, we closed the sale of our minority ownership in Noverco. The weighted average number of common shares outstanding was reduced by our pro-rata weighted average interest in our own common shares of approximately 2 million and 5 million as at December 31, 2021 and 2020, respectively, resulting from our reciprocal investment in Noverco.

DILUTED
The treasury stock method is used to determine the dilutive impact of stock options and RSUs. This method assumes any proceeds from the exercise of stock options and vesting of RSUs would be used to purchase common shares at the average market price during the period.

Weighted average shares outstanding used to calculate basic and diluted earnings per share are as follows:

December 31,	**2022**	2021	2020
(number of shares in millions)			
Weighted average shares outstanding	**2,025**	2,023	2,020
Effect of dilutive options and RSUs	**4**	2	1
Diluted weighted average shares outstanding	**2,029**	2,025	2,021

For the years ended December 31, 2022, 2021 and 2020, 10.4 million, 18.6 million and 29.8 million, respectively, of anti-dilutive stock options with a weighted average exercise price of $56.49, $52.89 and $51.42, respectively, were excluded from the diluted earnings per common share calculation.

7. REGULATORY MATTERS

We record assets and liabilities that result from regulated ratemaking processes that would not be recorded under US GAAP for non-regulated entities. See *Note 2 - Significant Accounting Policies* for further discussion. Our significant regulated businesses and the related accounting impacts are described below.

Under the current authorized rate structure for certain operations, income tax costs are recovered in rates based on the current income tax payable and do not include accruals for deferred income tax. However, as income taxes become payable as a result of the reversal of temporary differences that created the deferred income taxes, it is expected that rates will be adjusted to recover these taxes. Since most of these temporary differences are related to property, plant and equipment costs, this recovery is expected to occur over the life of the related assets. In the absence of rate-regulated accounting, this regulatory Deferred income taxes balance and the related earnings impact would not be recorded.

LIQUIDS PIPELINES

Canadian Mainline

Canadian Mainline includes the Canadian portion of our mainline system and is subject to regulation by the CER. Tolls, excluding Lines 8 and 9, are governed by the 10-year CTS which expired on June 30, 2021. The tolls in place on June 30, 2021 continue on an interim basis until new tolls are finalized and approved by the CER *(Note 4).* The CTS established a Canadian Local Toll for all volumes shipped on the Canadian Mainline and an International Joint Tariff for all volumes shipped from western Canadian receipt points to delivery points on our Lakehead System. Under the CTS, we have recognized a regulatory asset of $2.1 billion as at December 31, 2022 (2021 - $2.1 billion) to offset deferred income taxes, as a CER rate order governing flow-through income tax treatment permits future recovery. No other material regulatory assets or liabilities are recognized under the terms of the CTS.

Southern Lights Pipeline

The US and Canadian portions of the Southern Lights Pipeline are regulated by the FERC and CER, respectively. Shippers on the Southern Lights Pipeline are subject to long-term transportation contracts under a cost-of-service toll methodology. Toll adjustments are filed annually with the regulators and provide for the recovery of allowable operating and debt financing costs, plus a pre-determined after-tax return on equity (ROE) of 10%.

GAS TRANSMISSION AND MIDSTREAM

British Columbia Pipeline and Maritimes & Northeast Canada

British Columbia (BC) Pipeline and Maritimes & Northeast (M&N) Canada are regulated by the CER. Rates are approved by the CER through negotiated toll settlement agreements based on cost-of-service. Both our BC Pipeline and M&N Canada systems currently operate under the terms of their respective 2022-2026 and 2022-2023 settlement agreements, which stipulate an allowable ROE and the continuation and establishment of certain deferral and variance accounts.

US Gas Transmission

Most of our US gas transmission and storage services are regulated by the FERC and may also be subject to the jurisdiction of various other federal, state and local agencies. The FERC regulates natural gas transmission in US interstate commerce including the establishment of rates for services, while rates for intrastate commerce and/or gathering services are regulated by the state agencies. Cost-of-service is the basis for the calculation of regulated tariff rates, although the FERC also allows the use of negotiated and discounted rates within contracts with shippers that may result in a rate that is above or below the FERC-regulated recourse rate for that service.

GAS DISTRIBUTION AND STORAGE

Enbridge Gas

Enbridge Gas' distribution rates, commencing in 2019, are set under a five-year Incentive Regulation (IR) framework using a price cap mechanism. The price cap mechanism establishes new rates each year through an annual base rate escalation at inflation less a 0.3% stretch factor, annual updates for certain costs to be passed through to customers, and where applicable, the recovery of material discrete incremental capital investments beyond those that can be funded through base rates. The IR framework includes the continuation and establishment of certain deferral and variance accounts, as well as an earnings sharing mechanism that requires Enbridge Gas to share equally with customers any earnings in excess of 150 basis points over the annual OEB approved ROE.

FINANCIAL STATEMENT EFFECTS

Accounting for rate-regulated activities has resulted in the recognition of the following regulatory assets and liabilities in the Consolidated Statements of Financial Position.

December 31,	**2022**	2021	Recovery/Refund Period Ends
(millions of Canadian dollars)			
Current regulatory assets			
Purchase gas variance	**190**	15	2023
Under-recovery of fuel costs	**109**	114	2023
Other current regulatory assets	**305**	130	2023
Total current regulatory assets[1] *(Note 9)*	**604**	259	
Long-term regulatory assets			
Deferred income taxes[2]	**4,473**	4,176	Various
Long-term debt[3]	**378**	398	2032-2046
Negative salvage[4]	**265**	243	Various
Purchase gas variance	**244**	215	2024
Accounting policy changes[5]	**219**	157	Various
Pension plan receivable[6]	**40**	78	Various
Other long-term regulatory assets	**244**	339	Various
Total long-term regulatory assets[1]	**5,863**	5,606	
Total regulatory assets	**6,467**	5,865	
Current regulatory liabilities			
Other current regulatory liabilities	**167**	106	2023
Total current regulatory liabilities[7]	**167**	106	
Long-term regulatory liabilities			
Future removal and site restoration reserves[8]	**1,615**	1,543	Various
Regulatory liability related to US income taxes[9]	**918**	895	2050-2072
Pipeline future abandonment costs *(Note 14)*	**610**	649	Various
Pension plan payable[6]	**231**	—	Various
Other long-term regulatory liabilities	**250**	234	Various
Total long-term regulatory liabilities[7]	**3,624**	3,321	
Total regulatory liabilities	**3,791**	3,427	

1 Current regulatory assets are included in Accounts receivable and other, while long-term regulatory assets are included in Deferred amounts and other assets.
2 Represents the regulatory offset to deferred income tax liabilities to the extent that it is expected to be included in future regulator-approved rates and recovered from customers. The recovery period depends on the timing of the reversal of temporary differences. In the absence of rate-regulated accounting, this regulatory balance and the related earnings impact would not be recorded.
3 Represents our regulatory offset to the fair value adjustment to debt acquired in our merger with Spectra Energy Corp. (Spectra Energy). The offset is viewed as a proxy for the regulatory asset that would be recorded in the event such debt was extinguished at an amount higher than the carrying value.
4 The negative salvage balance represents the recovery in future rates of the actual cost of removal of previously retired or decommissioned plant assets, as approved by the FERC.
5 This deferral primarily consists of unamortized accumulated actuarial gains/losses and past service costs incurred by Union Gas Limited, relating to the period up to our merger with Spectra Energy, which were previously recorded in AOCI. The amortization of this balance is recognized as a component of accrual-based pension expenses, which are included in Other income/(expense) and recovered in rates, as previously approved by the OEB.
6 Represents the regulatory offset to our pension liability to the extent that it is expected to be included in regulator-approved future rates and recovered from customers. The settlement period for this balance is not determinable. In the absence of rate-regulated accounting, this regulatory balance and the related pension expense would be recorded in earnings and OCI.
7 Current regulatory liabilities are included in Accounts payable and other, while long-term regulatory liabilities are included in Other long-term liabilities.

8 *Future removal and site restoration reserves consists of amounts collected from customers, with the approval of the OEB, to fund future costs of removal and site restoration relating to property, plant and equipment. These costs are collected as part of the depreciation expense charged on property, plant and equipment that is reflected in rates. The settlement of this balance will occur over the long-term as costs are incurred. In the absence of rate-regulated accounting, depreciation rates would not include a charge for removal and site restoration and costs would be charged to earnings as incurred with recognition of revenue for amounts previously collected.*

9 *The regulatory liability related to US income taxes resulted from the US tax reform legislation dated December 22, 2017. These balances will be refunded to customers in accordance with the respective rate settlements approved by the FERC.*

8. ACQUISITIONS AND DISPOSITIONS

ACQUISITIONS

Tri Global Energy, LLC

On September 27, 2022, through a wholly-owned US subsidiary, we acquired all of the outstanding common units in TGE for cash consideration of $295 million (US$215 million) plus potential contingent payments of up to $72 million (US$53 million) dependent on the achievement of performance milestones by TGE (the TGE Acquisition). The TGE Acquisition is subject to customary closing and working capital adjustments. TGE is an onshore renewable project developer in the US with a development portfolio of wind and solar projects. The TGE Acquisition enhances Enbridge's renewable power platform and accelerates our North American growth strategy.

We accounted for the TGE Acquisition using the acquisition method as prescribed by ASC 805 *Business Combinations*. In accordance with valuation methodologies described in ASC 820 *Fair Value Measurements*, the acquired assets and assumed liabilities are recorded at their estimated fair values as at the date of acquisition.

The following table summarizes the estimated fair values that were assigned to the net assets of TGE:

	September 27, 2022
(millions of Canadian dollars)	
Fair value of net assets acquired:	
Current assets	**5**
Property, plant and equipment	**3**
Long-term investments	**8**
Intangible assets (a)	**117**
Long-term assets	**3**
Current liabilities	**61**
Long-term debt *(Note 18)*	**18**
Long-term liabilities (b)	**105**
Goodwill (c)	**392**
Purchase price:	
Cash	**295**
Contingent consideration (d)	**49**
	344

a) Intangible assets consist of compensation expected to be earned by TGE on existing development contracts once certain project development milestones are met. Fair value was determined using a discounted cash flow method which is an income-based approach to valuation that estimates the present value of future projected benefits from the contracts. The intangible assets will be amortized on a straight-line basis over an expected useful life of three and a half years.

b) Long-term liabilities consist primarily of obligations payable to third parties which are contingent on the timing of milestones being met for certain projects. Fair value represents the present value of the future cash flow payments at the date of the TGE Acquisition.

c) Goodwill is primarily attributable to expected future returns from new opportunities to develop wind and solar projects, as well as enhanced scale and operational diversity of our renewable projects portfolio. The goodwill balance recognized has been assigned to our Renewable Power Generation segment and is tax deductible over 15 years.

d) We agreed to pay additional contingent consideration of up to US$53 million to TGE's former common unit holders if performance milestones are met on certain projects. The US$36 million of contingent consideration recognized in the purchase price represents the fair value of contingent consideration at the date of acquisition. The fair value was determined using an income-based approach.

Upon completion of the TGE Acquisition, we began consolidating TGE. For the period beginning September 27, 2022 through to December 31, 2022, operating revenues and earnings attributable to common shareholders generated by TGE were immaterial. The impact to our supplemental pro forma consolidated operating revenues and earnings attributable to common shareholders for the years ended December 31, 2022 and 2021, as if the TGE Acquisition had been completed on January 1, 2021, was also immaterial.

Moda Midstream Operating, LLC
On October 12, 2021, through a wholly-owned US subsidiary, we acquired all of the outstanding membership interests in Moda for $3.7 billion (US$3.0 billion) of cash plus potential contingent payments of up to US$150 million dependent on performance of the assets (the Moda Acquisition). The Moda Acquisition was also subject to customary closing and working capital adjustments. Moda owns and operates a light crude export platform with very large crude carrier capability. The Moda Acquisition aligns with and advances our US Gulf Coast export strategy and enables connectivity to low-cost and long-lived reserves in the Permian and Eagle Ford basins.

We accounted for the Moda Acquisition using the acquisition method as prescribed by ASC 805 *Business Combinations*. In accordance with valuation methodologies described in ASC 820 *Fair Value Measurements*, the acquired assets and assumed liabilities were recorded at their estimated fair values as at the date of acquisition.

The following table summarizes the estimated fair values that were assigned to the net assets of Moda:

	October 12, 2021
(millions of Canadian dollars)	
Fair value of net assets acquired:	
Current assets	62
Property, plant and equipment (a)	1,480
Long-term investments (b)	427
Intangible assets (c)	1,781
Current liabilities	59
Long-term liabilities	17
Goodwill (d)	268
Purchase price:	
Cash	3,755
Contingent consideration (e)	187
	3,942

a) Due to the specialized nature of Moda's property, plant and equipment, which includes groups of assets configured for use as storage facilities, pipelines and export terminals, the depreciated replacement cost approach was adopted as the primary valuation methodology. In determining replacement cost, both indirect costing using relevant inflation indices and direct costing using relevant market quotes were utilized. Adjustments were then applied for physical deterioration as well as functional and economic obsolescence. The fair value of land was determined using a market approach, which is based on rents and offerings for comparable properties.

b) Long-term investments represent Moda's 20% equity interest in Cactus II Pipeline LLC (Cactus II). The fair value of Cactus II was determined using the discounted cash flow method. The discounted cash flow method is an income-based approach to valuation which estimates the present value of future projected benefits from the investment.

c) Intangible assets consist primarily of customer relationships associated with long-term take-or-pay contracts. Fair value was determined using an income-based approach by estimating the present value of the after-tax earnings attributable to the contracts, including earnings associated with expected renewal terms, and will be amortized on a straight-line basis over an expected useful life of 10 years.

d) Goodwill is primarily attributable to uncontracted future revenues, existing assembled assets that cannot be duplicated at the same cost by a new entrant, and enhanced scale and geographic diversity which provide greater optionality and platforms for future growth. The goodwill balance recognized has been assigned to our Liquids Pipelines segment and is tax deductible over 15 years.

e) We agreed to pay additional contingent consideration of up to US$150 million to Moda's former membership interest holders if Moda's monthly volumes of crude oil loaded onto a vessel equal or exceed specified throughput levels. These performance requirements terminate the earlier of December 31, 2023 or the date the final contingent payment is made. The US$150 million of contingent consideration recognized in the purchase price represents the fair value of contingent consideration at the date of acquisition and was fully settled as at December 31, 2022.

Acquisition-related expenses incurred were approximately $21 million for the year ended December 31, 2021 and are included in Operating and administrative expense in the Consolidated Statements of Earnings.

Upon completion of the Moda Acquisition, we began consolidating Moda. For the period beginning October 12, 2021 through to December 31, 2021, Moda generated approximately $80 million in operating revenues and $9 million in earnings attributable to common shareholders.

Our supplemental pro forma consolidated financial information for the years ended December 31, 2021 and 2020, including the results of operations for Moda as if the Moda Acquisition had been completed on January 1, 2020, are as follows:

Year ended December 31,	2021	2020
(unaudited; millions of Canadian dollars)		
Operating revenues	47,339	39,435
Earnings attributable to common shareholders[1,2]	5,771	2,938

1 Acquisition-related expenses of $21 million (after-tax $16 million) were excluded from earnings attributable to common shareholders for the year ended December 31, 2021 and deducted for the year ended December 31, 2020.
2 Includes the amortization of fair value adjustments recorded for acquired property, plant and equipment, long-term investments and intangible assets of $193 million and $207 million (after-tax of $145 million and $155 million) for the years ended December 31, 2021 and 2020, respectively.

DISPOSITIONS

Athabasca Regional Oil Sands System

On October 5, 2022, we closed the sale of an 11.6% non-operating interest in seven pipelines in the Athabasca region of northern Alberta from our Regional Oil Sands System to Athabasca Indigenous Investments Limited Partnership (Aii), an entity representing 23 First Nation and Métis communities, for total consideration of approximately $1.1 billion, less customary closing adjustments. No gain or loss was recognized on the sale and a noncontrolling interest was recorded in our Consolidated Statements of Financial Position as at December 31, 2022 to reflect the interest held by Aii *(Note 20)*.

Subsequent to the sale, we maintained an 88.4% controlling interest in these assets, which are a component of our Liquids Pipelines segment, and continue to manage, operate and provide administrative services to them.

Line 10 Crude Oil Pipeline

In the first quarter of 2018, we satisfied the condition as set out in our agreements for the sale of our Line 10 crude oil pipeline (Line 10), which originates near Hamilton, Ontario and terminates at West Seneca, New York. Our subsidiaries, Enbridge Pipelines Inc. and Enbridge Energy Partners, L.P. owned the Canadian and US portions of Line 10, respectively, and the related assets were included in our Liquids Pipelines segment. The transaction closed on June 1, 2020. No gain or loss on disposition was recorded.

Montana-Alberta Tie Line

On May 1, 2020, we closed the sale of the Montana-Alberta Tie Line (MATL) transmission asset, a 345 kilometer transmission line from Great Falls, Montana to Lethbridge, Alberta, for cash proceeds of approximately $189 million. After closing adjustments, a gain on disposal of $4 million was included in Other income/(expense) in the Consolidated Statements of Earnings. MATL was included in our Renewable Power Generation segment.

Ozark Gas Transmission

On April 1, 2020, we closed the sale of our Ozark Gas Transmission and Ozark Gas Gathering assets (Ozark assets) for cash proceeds of approximately $63 million. After closing adjustments, a gain on disposal of $1 million was included in Other income/(expense) in the Consolidated Statements of Earnings. The Ozark assets are composed of a transmission system that extends from southeastern Oklahoma through Arkansas to southeastern Missouri, and a fee-based gathering system that accesses Fayetteville Shale and Arkoma production. These assets were included in our Gas Transmission and Midstream segment.

9. ACCOUNTS RECEIVABLE AND OTHER

December 31,	**2022**	2021
(millions of Canadian dollars)		
Trade receivables and unbilled revenues[1]	**5,616**	4,957

Taxes receivable	**323**	407
Other	**852**	434
	8,871	6,862

1 Net of allowance for expected credit losses of $92 million and $87 million as at December 31, 2022 and 2021, respectively.

10. INVENTORY

December 31,	2022	2021
(millions of Canadian dollars)		
Natural gas	**1,491**	953
Crude oil	**652**	624
Other	**112**	93
	2,255	1,670

11. PROPERTY, PLANT AND EQUIPMENT

December 31,	Weighted Average Depreciation Rate	2022	2021
(millions of Canadian dollars)			
Pipelines	2.9 %	**66,528**	62,997
Facilities and equipment	3.5 %	**37,028**	34,331
Land and right-of-way[1]	2.2 %	**3,637**	3,320
Gas mains, services and other	2.6 %	**14,491**	13,606
Storage	2.3 %	**3,477**	3,099
Wind turbines, solar panels and other	4.1 %	**4,912**	4,912
Other	8.5 %	**1,611**	1,507
Under construction	— %	**2,316**	2,268
Total property, plant and equipment		**134,000**	126,040
Total accumulated depreciation		**(29,540)**	(25,973)
Property, plant and equipment, net		**104,460**	100,067

1 The measurement of weighted average depreciation rate excludes non-depreciable assets.

Depreciation expense for the years ended December 31, 2022, 2021 and 2020 was $3.8 billion, $3.5 billion and $3.4 billion, respectively.

IMPAIRMENT

Magic Valley Wind Farm

Magic Valley Wind Farm (Magic Valley) has commercial challenges caused by electricity transmission congestion and a negative price differential arising from higher transmission costs resulting in a lower electricity sale price. As a result, we have recognized an impairment loss of $227 million to our investment in Magic Valley, which is included in Impairment of long-lived assets in the Consolidated Statements of Earnings and is part of our Renewable Power Generation segment.

Bakken Pipeline System

The Bakken Pipeline System currently has long-term take-or-pay contracts that are set to expire in 2023. In connection with the upcoming expiration of the contracts, we have recognized an impairment loss of $183 million on the US and Canadian components of the interstate pipeline transportation system within the North Dakota System of our Bakken System, which is included in Impairment of long-lived assets in the Consolidated Statements of Earnings and is part of our Liquids Pipelines segment.

Impairment charges were based on the amount by which the carrying value of the assets exceeded fair value, determined using expected discounted future cash flows.

12. VARIABLE INTEREST ENTITIES

CONSOLIDATED VARIABLE INTEREST ENTITIES

Our consolidated VIEs consist of legal entities where we are the primary beneficiary. We are the primary beneficiary when our variable interest(s) provide us with (i) the power to direct the activities of the VIE that most significantly impact the VIE's economic performance and (ii) the obligation to absorb losses of the VIE or the right to receive benefits from the VIE that could potentially be significant to the VIE. We determine whether we are the primary beneficiary of a VIE by considering qualitative and quantitative factors, including, but not limited to: decision-making responsibilities, the VIE capital structure, risk and rewards sharing, contractual agreements with the VIE, voting rights and level of involvement of other parties.

The following table includes assets to be used to settle liabilities of our consolidated VIEs. The creditors of the liabilities of our consolidated VIEs do not have recourse to our general credit as the primary beneficiary. These assets and liabilities are included in the Consolidated Statements of Financial Position.

December 31,	**2022**[1]	2021
(millions of Canadian dollars)		
Assets		
Cash and cash equivalents	**426**	247

	1,136	271
	7,615	3,367

1 *Includes assets and liabilities of newly created Enbridge Athabasca Midstream Trunkline LP and Enbridge Athabasca Midstream Investor LP following the sale of a minority interest in certain Athabasca Regional Oil Sands System assets. Refer to* Note 8 - Acquisitions and Dispositions.

We do not have obligations to provide additional financial support to any of our consolidated VIEs.

UNCONSOLIDATED VARIABLE INTEREST ENTITIES

We currently hold interests in several non-consolidated VIEs where we are not the primary beneficiary as we do not have the power to direct the activities of the VIEs that most significantly impact their economic performance. These interests include investments in limited partnerships that are assessed to be VIEs due to the limited partners not having substantive kick-out rights or participating rights. The power to direct the activities of a majority of these non-consolidated limited partnership VIEs is shared amongst the partners. Each partner has representatives that make up an executive committee that makes significant decisions for the VIE, and none of the partners may make significant decisions unilaterally.

The carrying amount of these VIEs and our estimated maximum exposure to loss as at December 31, 2022 and 2021 are presented below:

December 31, 2022	Carrying Amount of the VIE	Maximum Exposure to Loss
(millions of Canadian dollars)		
Aux Sable Liquid Products L.P.[1]	**91**	**117**
EIH S.á r.l.[2]	**37**	**637**
Rampion Offshore Wind Limited[3]	**413**	**468**
Vector Pipeline L.P.[4]	**195**	**325**
Woodfibre LNG Limited Partnership[5,6]	**635**	**2,476**
Other[7]	**245**	**443**
	1,616	**4,466**

December 31, 2021	Carrying Amount of the VIE	Maximum Exposure to Loss
(millions of Canadian dollars)		
Aux Sable Liquid Products L.P.[1]	113	195
EIH S.á r.l.[2]	38	664
Enbridge Renewable Infrastructure Investments S.á r.l.[8,9]	54	2,121
Rampion Offshore Wind Limited[3]	450	508
Vector Pipeline L.P.[4]	189	374
Other[7]	210	426
	1,054	4,288

1 *As at December 31, 2022 and 2021, the maximum exposure to loss includes a guarantee by us for our respective share of the VIE's borrowing on a bank credit facility.*
2 *As at December 31, 2022 and 2021, the maximum exposure to loss includes our parental guarantees that have been committed in connection with the three French offshore wind projects for which we would be liable in the event of default by the VIE and an outstanding affiliate loan receivable for $56 million and $73 million held by us as at December 31, 2022 and 2021, respectively.*
3 *As at December 31, 2022 and 2021, the maximum exposure to loss includes our parental guarantees that have been committed in project contracts in which we would be liable for in the event of default by the VIE.*
4 *As at December 31, 2022 and 2021, the maximum exposure to loss includes the carrying value of outstanding affiliate loans receivable for $25 million and $80 million held by us as at December 31, 2022 and 2021, respectively, and an outstanding credit facility for $105 million as at December 31, 2022 and 2021.*
5 *In November 2022, Enbridge acquired a 30% interest in Woodfibre LNG Limited Partnership (Woodfibre). Refer to* Note 13 - Long-Term Investments. *Woodfibre is a VIE due to its lack of sufficient equity at risk to finance its activities. Enbridge does not hold decision-making rights to direct Woodfibre's activities that most significantly impact its economic performance.*
6 *As at December 31, 2022, the maximum exposure to loss includes our parental guarantees that have been committed in connection with the project for which we would be liable in the event of default by the VIE.*
7 *As at December 31, 2022 and 2021, the maximum exposure to loss includes our parental guarantees that have been committed in connection with the projects for which we would be liable in the event of default by the VIE.*
8 *As at December 31, 2021, the maximum exposure to loss included our parental guarantees that have been committed in connection with the project for which we would be liable in the event of default by the VIE and an outstanding affiliate loan receivable for $807 million held by us as at December 31, 2021.*
9 *Following a reconsideration event in connection with an additional equity injection to facilitate debt and equity rebalancing of Enbridge Renewable Infrastructure Investments S.á r.l. (ERII) in the third quarter of 2022, ERII's equity is now sufficient for it to finance its activities without additional subordinated financial support. Therefore, it is no longer considered to be a VIE.*

We do not have an obligation to and did not provide any additional financial support to the VIEs during the years ended December 31, 2022 and 2021.

1 *Owns a 49.0% interest in Bakken Pipeline Investments L.L.C. Bakken Pipeline Investments L.L.C. owns 75.0% of the Bakken Pipeline System, resulting in a 27.6% effective interest in the Bakken Pipeline System by us.*
2 *We own 90.0% of the Class B units of DCP Midstream, LLC. These units track to a 65.0% ownership in Gray Oak Pipeline, LLC (Gray Oak), resulting in a 58.5% effective interest in Gray Oak by us. In 2021, we owned a 35.0% interest in Gray Oak Holdings LLC, which owned a 65.0% interest in Gray Oak, resulting in a 22.8% effective interest in Gray Oak by us.*
3 *Owns the Southern Access Extension Project.*
4 *On October 12, 2021, we acquired an effective 20.0% interest in Cactus II through the acquisition of Moda. Refer to* Note 8 - Acquisitions and Dispositions *for further discussion. On November 2, 2022, we acquired an additional 10.0% ownership in Cactus II for cash payment of $241 million (US$177 million), bringing our total non-operating ownership to 30.0%.*
5 *Includes Alliance Pipeline Limited Partnership in Canada and Alliance Pipeline L.P. in the US.*
6 *Includes Aux Sable Canada LP in Canada and Aux Sable Liquid Products LP and Aux Sable Midstream LLC in the US.*

7 We own 23.4% of the Class A units of DCP Midstream, LLC. These units track to a 56.5% ownership in DCP Midstream, LP (DCP), resulting in a 13.2% effective interest in DCP by us. In 2021, we owned an effective 28.3% interest in DCP.
8 Includes Vector Pipeline Limited Partnership in Canada and Vector Pipeline L.P. in the US.
9 On March 18, 2021, we sold 49.0% of EIH S.à.r.l., an entity that holds our 50.0% interest in Éolien Maritime France SAS (EMF), to the Canada Pension Plan Investment Board. This resulted in a 25.5% effective interest in EMF. Through our investment in EMF, we own equity interests in three French offshore wind projects, including effective interests in Saint-Nazaire (25.5%), Fécamp (17.9%) and Calvados (21.7%).
10 On August 2, 2022, we acquired a 10.0% interest in Oakville Enterprises Corporation.
11 Consists of investments in debt and equity securities held by our wholly-owned captive insurance subsidiaries. Refer to Note 24 -Risk Management and Financial Instruments.

Equity investments include the unamortized excess of the purchase price over the underlying net book value of the investees' assets at the purchase date. As at December 31, 2022, this basis difference was $3.4 billion (2021 - $2.5 billion), of which $1.5 billion (2021 - $730 million) was amortizable.

For the years ended December 31, 2022, 2021 and 2020, distributions received from equity investments were $2.6 billion, $2.2 billion and $2.1 billion, respectively.

Summarized combined financial information of our interest in unconsolidated equity investments (presented at 100%) is as follows:

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Operating revenues	**27,043**	20,021	14,096
Operating expenses	**23,043**	16,706	12,411
Earnings	**4,334**	3,022	2,324

(millions of Canadian dollars)		
Current assets	**4,196**	3,639
Non-current assets	**53,405**	44,863
Current liabilities	**4,843**	3,741
Non-current liabilities	**18,595**	16,979
Noncontrolling interests	**3,785**	3,786

DCP Midstream, LLC
On August 17, 2022, we completed a joint venture merger transaction with Phillips 66 (P66) resulting in a single joint venture, DCP Midstream, LLC, holding both our and P66's indirect ownership interests in Gray Oak and DCP. Our ownership in DCP Midstream, LLC consists of Class A and Class B Interests which track to our investments in DCP, included in the Gas Transmission and Midstream segment, and Gray Oak, included in the Liquids Pipelines segment, respectively. Through our investment in DCP Midstream, LLC, we increased our effective economic interest in Gray Oak to 58.5% from 22.8% and reduced our effective economic interest in DCP to 13.2% from 28.3%. As a result of the transaction, Enbridge will assume operatorship of Gray Oak in the second quarter of 2023.

We determined the fair value of our decrease in economic interest in DCP based on the unadjusted quoted market price of DCP’s publicly traded common units on the transaction closing date. The fair value of our increased economic interest in Gray Oak was determined using the fair value prescribed to the change in our economic interest in DCP. As a result of the merger transaction and the realignment of our economic interests in DCP and Gray Oak, we also received cash consideration of approximately $522 million (US$404 million) and recorded an accounting gain of $1.1 billion (US$832 million) to Gain on joint venture merger transaction in the Consolidated Statements of Earnings. Both DCP and Gray Oak continue to be accounted for as equity method investments.

Woodfibre LNG Limited Partnership
On November 29, 2022, Enbridge acquired, for cash payment of $533 million (US$392 million), an effective 30.0% interest in Woodfibre. Woodfibre will operate a liquified natural gas export facility in BC being constructed by us and our partners.

Noverco Inc.
On June 7, 2021, IPL System Inc., a wholly-owned subsidiary of Enbridge, entered into a purchase and sale agreement to sell its 38.9% common share and preferred share interest in Noverco to Trencap L.P. On December 30, 2021, we closed the sale of Noverco for cash proceeds of $1.1 billion. After closing adjustments, a gain on disposal of $303 million before tax was included in Other income/(expense) in the Consolidated Statements of Earnings for the year ended December 31, 2021. Noverco was previously included in our Gas Distribution and Storage segment.

IMPAIRMENT OF EQUITY INVESTMENTS
PennEast Pipeline Company, LLC
PennEast Pipeline Company, LLC (PennEast) is a joint venture formed to develop a natural gas transmission pipeline to serve local distribution companies and power generators in southeastern Pennsylvania and New Jersey, is owned 20.0% by Enbridge, and is recorded as an equity method investment. In the third quarter of 2021, PennEast determined further development of the project was no longer viable and development of the project was ceased. As a result, we recorded an other-than-temporary impairment loss of $111 million on our investment for the year ended December 31, 2021 based on the estimated fair value of our share of the net assets. The carrying value of this investment as at December 31, 2022 and 2021 was nil and $12 million, respectively.

Steckman Ridge, LP
Steckman Ridge, LP (Steckman Ridge) is engaged in the storage of natural gas, is owned 50.0% by Enbridge, and is recorded as an equity method investment. During the year ended December 31, 2020, Steckman Ridge's forecasted performance was adjusted for the expectation that future available capacity will be re-contracted at lower than expected rates. As a result, we recorded an other-than-temporary impairment loss of $221 million on our investment for the year ended December 31, 2020 based on a discounted cash flow analysis. The carrying value of this investment as at December 31, 2022 and 2021 was $91 million and $88 million, respectively.

Southeast Supply Header, L.L.C.
Southeast Supply Header, L.L.C. (SESH) provides natural gas transmission services from east Texas and northern Louisiana to the southeast markets of the Gulf Coast, is owned 50.0% by Enbridge, and is recorded as an equity method investment. The forecasted performance of SESH was revised during the year ended December 31, 2020 to reflect downward revisions to future negotiated rates as well as higher than expected available capacity levels, caused primarily by a significant contract expiry. As a result, we recorded an other-than-temporary impairment loss of $394 million on our investment for the year ended December 31, 2020 based on a discounted cash flow analysis. The carrying value of this investment as at December 31, 2022 and 2021 was $86 million and $82 million, respectively.

DCP Midstream, LLC
DCP Midstream, LLC, an entity of which we had a 50.0% ownership interest in prior to the joint venture merger transaction with P66, holds an equity interest in DCP. A decline in the market price of DCP's publicly traded units during the first quarter of 2020 resulted in an other-than-temporary impairment loss on our investment in DCP Midstream, LLC of $1.7 billion for the year ended December 31, 2020. In addition, we incurred losses of $324 million through our equity earnings pick up in relation to asset and goodwill impairment losses recorded by DCP. The carrying value of our investment in DCP Midstream, LLC (Class A Units) as at December 31, 2022 and 2021 was $317 million and $397 million, respectively.

Our investments in PennEast, Steckman, SESH and DCP Midstream, LLC (Class A Units) form part of our Gas Transmission and Midstream segment. The impairment losses were recorded within Impairment of equity investments in the Consolidated Statements of Earnings.

14. RESTRICTED LONG-TERM INVESTMENTS

Effective January 1, 2015, we began collecting and setting aside funds to cover future pipeline abandonment costs for all CER regulated pipelines as a result of the CER's regulatory requirements under LMCI. The funds collected are held in trusts in accordance with the CER decision. The funds collected from shippers are reported within Transportation and other services revenues in the Consolidated Statements of Earnings and Restricted long-term investments in the Consolidated Statements of Financial Position. Concurrently, we reflect the future abandonment cost as an increase to Operating and administrative expense in the Consolidated Statements of Earnings and Other long-term liabilities in the Consolidated Statements of Financial Position.

We routinely invest excess cash and various restricted balances in securities such as commercial paper, bankers acceptances, corporate debt securities, Canadian equity securities, treasury bills and money market securities in the US and Canada.

As at December 31, 2022 and 2021, we had restricted long-term investments held in trust and classified as available-for-sale of $593 million and $630 million, respectively.

We had Restricted long-term investments held in trust totaling $236 million and $217 million as at December 31, 2022 and 2021, respectively, which are classified as Level 1 in the fair value hierarchy.
We also had Restricted long-term investments held in trust totaling $357 million (cost basis - $437 million) and $413 million (cost basis - $383 million) as at December 31, 2022 and 2021, respectively, which are classified as Level 2 in the fair value hierarchy. There were unrealized holding losses of $122 million and $8 million on our Restricted long-term investments for the years ended December 31, 2022 and 2021, respectively. Within Other long-term liabilities we had estimated future abandonment costs related to LMCI of $610 million and $649 million as at December 31, 2022 and 2021, respectively *(Note 7)*.

15. INTANGIBLE ASSETS

December 31, 2022	Weighted Average Amortization Rate	Cost	Accumulated Amortization	Net

Balance at December 31, 2022[1,2]	**8,547**	**18,106**	**5,397**	**388**	**2**	**32,440**

1 Gross goodwill as at December 31, 2022 and 2021 was $36.5 billion and $34.4 billion, respectively.
2 Accumulated impairment as at December 31, 2022 and 2021 was $4.1 billion and $1.6 billion, respectively.
3 In 2021 we recorded $268 million of goodwill related to the acquisition of Moda. Refer to Note 8 - Acquisitions and Dispositions.
4 In 2022, we recorded $392 million of goodwill related to the acquisition of TGE. Refer to Note 8 - Acquisitions and Dispositions.

IMPAIRMENT
Gas Transmission
During the year ended December 31, 2022, we recorded goodwill impairment of $2.5 billion related to our Gas Transmission reporting unit. The fair value of the reporting unit, determined using a combination of discounted cash flow and earnings multiples techniques, was impacted by a rise in cost of capital and lower projected long term growth rates for our existing assets.

17. ACCOUNTS PAYABLE AND OTHER

Short-term borrowings[8]			**(1,996)**	(1,515)
Long-term debt			**72,939**	67,961

1 For an initial five or 10 years, the notes carry a fixed interest rate. Subsequently, during each reset period the interest rate will be reset to equal to the Five-Year US Treasury rate or Five-Year Government of Canada bond yield plus a margin. The notes would be converted automatically into Conversion Preference Shares in the event of bankruptcy and related events.

2 For an initial five or 10 years, the notes carry a fixed interest rate. Subsequently, the interest rate will be floating and set to equal to the Canadian Dollar Offered Rate or the London Interbank Offered Rate (LIBOR) plus a margin. The notes would be converted automatically into Conversion Preference Shares in the event of bankruptcy and related events.

3 The notes carry an interest rate equal to Secured Overnight Financing Rate (SOFR) plus a margin of 40 basis points and SOFR plus a margin of 63 basis points.

4 Primarily finance lease obligations.

5 Included in medium-term notes is $100 million with a maturity date of 2112.

6 Primarily unamortized discounts, premiums and debt issuance costs.

7 2022 - $38 billion and US$31 billion; 2021 - $36 billion and US$31 billion. Totals exclude capital lease obligations, unamortized discounts, premiums and debt issuance costs and fair value adjustment.

8 Weighted average interest rates on outstanding commercial paper were 4.5% as at December 31, 2022 (2021 - 0.5%).

9 Calculated based on term notes, debentures, commercial paper and credit facility draws outstanding as at December 31, 2022.

As at December 31, 2022, all outstanding debt was unsecured.

CREDIT FACILITIES

The following table provides details of our committed credit facilities as at December 31, 2022:

	Maturity[1]	Total Facilities	Draws[2]	Available
(millions of Canadian dollars)				
Enbridge Inc.	2023-2027	**10,987**	**7,984**	**3,003**
Enbridge (U.S.) Inc.	2024-2027	**8,604**	**4,199**	**4,405**
Enbridge Pipelines Inc.	2024	**2,000**	**312**	**1,688**
Enbridge Gas Inc.	2024	**2,000**	**2,000**	**—**
Total committed credit facilities		**23,591**	**14,495**	**9,096**

1 Maturity date is inclusive of the one-year term out option for certain credit facilities.
2 Includes facility draws and commercial paper issuances that are back-stopped by credit facilities.

On February 10, 2022, we renewed our three year $1.0 billion sustainability-linked credit facility, extending the maturity date out to July 2025.

On May 17, 2022, we entered into a three year term loan with a syndicate of Japanese banks for approximately $806 million (¥84.8 billion), which will mature in May 2025 and replaces the approximately $499 million (¥52.5 billion) term loan that matured in May 2022. Additionally, on May 24, 2022, we entered into a 364-day term loan for approximately $1.9 billion, which will mature in May 2023.

On June 23, 2022, we renewed approximately $5.5 billion of our 364-day extendible credit facilities to July 2024, which includes a one-year term out provision from July 2023.

In July and August 2022, we renewed $12.7 billion of our credit facilities, extending the maturity dates of our 364-day credit facilities to July 2024, inclusive of a one year term out provision from July 2023, and our five year facilities out to July 2027. As a part of the renewals, we increased our credit facilities by approximately $640 million.

On December 16, 2022, Enbridge (U.S.) Inc. entered into a five year delay draw term loan in support of solar self-power projects for approximately $479 million, which will mature in December 2027.

In addition to the committed credit facilities noted above, we maintain $1.3 billion of uncommitted demand letter of credit facilities, of which $689 million was unutilized as at December 31, 2022. As at December 31, 2021, we had $1.3 billion of uncommitted demand letter of credit facilities, of which $854 million was unutilized.

Our credit facilities carry a weighted average standby fee of 0.1% per annum on the unused portion and draws bear interest at market rates. Certain credit facilities serve as a back-stop to the commercial paper programs and we have the option to extend such facilities, which are currently scheduled to mature from 2023 to 2027.

As at December 31, 2022 and 2021, commercial paper and credit facility draws, net of short-term borrowings and non-revolving credit facilities that mature within one year, of $10.5 billion and $11.3 billion, respectively, were supported by the availability of long-term committed credit facilities and, therefore, have been classified as long-term debt.

LONG-TERM DEBT ISSUANCES

During the year ended December 31, 2022, we completed the following long-term debt issuances totaling US$3.2 billion and $3.4 billion:

Company	Issue Date			Principal Amount
(millions of Canadian dollars unless otherwise stated)				
Enbridge Inc.				
	January 2022	5.00%	fixed-to-fixed subordinated notes due January 2082[1]	$750
	February 2022	Floating rate senior notes due February 2024[2]		US$600
	February 2022	2.15%	senior notes due February 2024	US$400
	February 2022	2.50%	senior notes due February 2025	US$500
	September 2022	7.38%	fixed-to-fixed subordinated notes due January 2083[3]	US$500
	September 2022	7.63%	fixed-to-fixed subordinated notes due January 2083[4]	US$600
	November 2022	5.70%	medium-term notes due November 2027	$600
	November 2022	6.10%	sustainability-linked medium-term notes due November 2032[5]	$900
	November 2022	6.51%	medium-term notes due November 2052	$500
Enbridge Gas Inc.				
	August 2022	4.15%	medium-term notes due August 2032	$325
	August 2022	4.55%	medium-term notes due August 2052	$325
Texas Eastern Transmission LP				
	December 2022	6.20%	senior notes due December 2032	US$600

1 For the initial 10 years, the notes carry a fixed interest rate. At year 10, the interest rate will be reset to equal to the Five-Year Government of Canada bond yield plus a margin of 3.54%. Subsequent to year 10, every five years, the Five-Year Government of Canada bond yield is reset. At year 30, the interest rate will be reset to equal to the Five-Year Government of Canada bond yield plus a margin of 4.29%.

2 Notes carry an interest rate set to equal the SOFR plus a margin of 63 basis points.

3 For the initial five years, the notes carry a fixed interest rate. At year five, the interest rate will be set to equal to the Five-Year US Treasury rate plus a margin of 3.71%. At year 10, the interest rate will be reset to equal the Five-Year US Treasury rate plus a margin of 3.96%. Subsequent to year 10, every five years, the Five-Year US Treasury rate is reset. At year 25, the interest rate will be reset to equal to the Five-Year US Treasury rate plus a margin of 4.71%.

4 For the initial 10 years, the notes carry a fixed interest rate. At year 10, the interest rate will be reset to equal to the Five-Year US Treasury rate plus a margin of 4.42%. Subsequent to year 10, every five years, the Five-Year US Treasury rate will be reset. At year 30, the interest rate will be reset to equal to the Five-Year US Treasury rate plus a margin of 5.17%.

5 The sustainability-linked medium-term notes are subject to a sustainability performance target of 35% reduction in emissions intensity at an observation date of December 31, 2030. If the target is not met, on November 9, 2031, the interest rate will be set to equal 6.10% plus a margin of 70 basis points.

LONG-TERM DEBT REPAYMENTS

During the year ended December 31, 2022, we completed the following long-term debt repayments totaling $1.5 billion and US$2.0 billion, respectively:

Company	Repayment Date			Principal Amount
(millions of Canadian dollars, unless otherwise stated)				
Enbridge Inc.				
	February 2022	Floating rate notes[1]		US$750
	February 2022	4.85%	medium-term notes	$200
	July 2022	2.90%	senior notes	US$700
	December 2022	3.19%	medium-term notes	$350
	December 2022	3.19%	medium-term notes	$450
Enbridge Gas Inc.				
	April 2022	4.85%	medium-term notes	$125
Enbridge Pipelines (Southern Lights) L.L.C.				
	June and December 2022	3.98%	senior notes	US$72
Enbridge Pipelines Inc.				
	November 2022	2.93%	medium-term notes	$150
Enbridge Southern Lights LP				
	June and December 2022	4.01%	senior notes	$18
Texas Eastern Transmission, LP				
	October 2022	2.80%	senior notes	US$500
Westcoast Energy Inc.				
	December 2022	3.12%	medium-term notes	$250

1 Notes carried an interest rate set to equal the Three-Month LIBOR plus a margin of 50 basis points.

DEBT COVENANTS

Our credit facility agreements and term debt indentures include standard events of default and covenant provisions whereby accelerated repayment and/or termination of the agreements may result if we were to default on payment or violate certain covenants. As at December 31, 2022, we were in compliance with all debt covenants.

INTEREST EXPENSE

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Debentures and term notes	**2,910**	2,806	2,873

	3,179	2,655	2,790

19. ASSET RETIREMENT OBLIGATIONS

Our ARO relate mostly to the retirement of pipelines, renewable power generation assets and obligations related to right-of way agreements and contractual leases for land use.

The discount rates used to estimate the present value of the expected future cash flows for the year ended December 31, 2022 ranged from 1.5% to 9.0% (2021 - 0.9% to 9.0%).

A reconciliation of movements in our ARO liabilities is as follows:

December 31,	**2022**	2021
(millions of Canadian dollars)		
Obligations at beginning of year	**502**	496
Liabilities incurred	**30**	—
Liabilities settled	**(126)**	(67)
Change in estimate and other	**51**	70
Foreign currency translation adjustment	**24**	(3)
Accretion expense	**7**	6
Obligations at end of year	**488**	502
Presented as follows:		
Accounts payable and other	**83**	160
Other long-term liabilities	**405**	342
	488	502

20. NONCONTROLLING INTERESTS

The following table provides additional information regarding Noncontrolling interests as presented in our Consolidated Statements of Financial Position:

December 31,	**2022**	2021
(millions of Canadian dollars)		
Algonquin Gas Transmission, LLC	**400**	377
Enbridge Athabasca Midstream Investor Limited Partnership[1]	**1,106**	—
Maritimes & Northeast Pipeline, L.L.C.	**582**	546
Renewable energy assets	**1,302**	1,503
Westcoast Energy Inc.[2]	**117**	116
Other	**4**	—
	3,511	2,542

1 *On October 5, 2022, we closed the sale of an 11.6% non-operating interest in certain assets from our Regional Oil Sands System to Aii. Refer to* Note 8 - Acquisitions and Dispositions.
2 *During 2021, Westcoast Energy Inc. redeemed all of its remaining Cumulative Five-Year Minimum Rate Reset Redeemable First Preferred Shares.*

21. SHARE CAPITAL

Our authorized share capital consists of an unlimited number of common shares with no par value and an unlimited number of preference shares.

Preference Shares, Series R	4.07 %	$1.01825	$25	June 1, 2024	Series S
Preference Shares, Series 1	5.95 %	US$1.48728	US$25	June 1, 2023	Series 2
Preference Shares, Series 3	3.74 %	$0.93425	$25	September 1, 2024	Series 4
Preference Shares, Series 5	5.38 %	US$1.34383	US$25	March 1, 2024	Series 6
Preference Shares, Series 7	4.45 %	$1.11224	$25	March 1, 2024	Series 8
Preference Shares, Series 9	4.10 %	$1.02424	$25	December 1, 2024	Series 10
Preference Shares, Series 11	3.94 %	$0.98452	$25	March 1, 2025	Series 12
Preference Shares, Series 13	3.04 %	$0.76076	$25	June 1, 2025	Series 14
Preference Shares, Series 15	2.98 %	$0.74576	$25	September 1, 2025	Series 16
Preference Shares, Series 19	4.90 %	$1.22500	$25	March 1, 2023	Series 20

1 *The holder is entitled to receive a fixed, cumulative, quarterly preferential dividend, as declared by the Board of Directors. With the exception of Preference Shares, Series A, such fixed dividend rate resets every five years beginning on the initial redemption and conversion option date. The Preference Shares, Series 19 contain a feature where the fixed dividend rate, when reset every five years, will not be less than 4.90%. No other series of Preference Shares has this feature.*

2 *Preference Shares, Series A may be redeemed any time at our option. For all other series of preference shares, we may at our option, redeem all or a portion of the outstanding preference shares for the Base Redemption Value per share plus all accrued and unpaid dividends on the Redemption Option Date and on every fifth anniversary thereafter.*

3 *The holder will have the right, subject to certain conditions, to convert their shares into Cumulative Redeemable Preference Shares of a specified series on a one-for-one basis on the Conversion Option Date and every fifth anniversary thereafter at an ascribed issue price equal to the Base Redemption Value.*

4 *With the exception of Preference Shares, Series A, after the redemption and conversion option dates, holders may elect to receive quarterly floating rate cumulative dividends per share at a rate equal to: $25 x (number of days in quarter/number of days in year) x Three-Month Government of Canada treasury bill rate + 2.4% (Series C), 2.4% (Series E), 2.5% (Series G), 2.1% (Series I), 2.7% (Series O), 2.5% (Series Q), 2.5% (Series S), 2.4% (Series 4), 2.6% (Series 8), 2.7% (Series 10), 2.6% (Series 12), 2.7% (Series 14), 2.7% (Series 16), or 3.2% (Series 20); or US$25 x (number of days in quarter/number of days in year) x Three-Month US Government treasury bill rate + 3.2% (Series M), 3.1% (Series 2) or 2.8% (Series 6).*

5 *The quarterly dividend per share paid on Preference Shares, Series B was increased to $0.32513 from $0.21340 on June 1, 2022 due to reset of the annual dividend on June 1, 2022. On June 1, 2022, all outstanding Preference Shares, Series C were converted to Preference Shares, Series B.*

6 *The quarterly dividend per share paid on Preference Shares, Series L was increased to US$0.36612 from US$0.30993 on September 1, 2022, due to reset of the annual dividend on September 1, 2022.*

SHAREHOLDER RIGHTS PLAN

The Shareholder Rights Plan is designed to encourage the fair treatment of our shareholders in connection with any takeover offer. Rights issued under the plan become exercisable when a person and any related parties acquires or announces its intention to acquire 20% or more of our outstanding common shares without complying with certain provisions set out in the plan or without approval of our Board of Directors. Should such an acquisition occur, each rights holder, other than the acquiring person and related parties, will have the right to purchase our common shares at a 50% discount to the market price at that time.

22. STOCK OPTION AND STOCK UNIT PLANS

We maintain three long-term incentive compensation plans: the ISO Plan, the PSU Plan and the RSU Plan. Total stock-based compensation expense recorded for the years ended December 31, 2022, 2021 and 2020 was $260 million, $157 million and $145 million, respectively. Disclosure of activity and assumptions for material stock-based compensation plans are included below.

INCENTIVE STOCK OPTIONS

Certain key employees are granted ISOs to purchase common shares at the grant date market price. ISOs vest in equal annual installments over a four-year period and expire 10 years after the issue date.

December 31, 2022	Number	Weighted Average Exercise Price	Weighted Average Remaining Contractual Life *(years)*	Aggregate Intrinsic Value
(options in thousands; weighted average exercise price in Canadian dollars; intrinsic value in millions of Canadian dollars)				
Options outstanding at beginning of year	**34,017**	**49.28**		
Options granted	**3,430**	**49.58**		
Options exercised[1]	**(8,684)**	**44.55**		
Options cancelled or expired	**(1,139)**	**51.32**		
Options outstanding at end of year	**27,624**	**48.46**	**5.7**	**133**
Options vested at end of year[2]	**17,631**	**49.20**	**4.4**	**84**

1 The total intrinsic value of ISOs exercised during the years ended December 31, 2022, 2021 and 2020 was $66 million, $24 million and $13 million, respectively, and cash received on exercise was $3 million, $2 million and $4 million, respectively.
2 The total fair value of ISOs exercised during the years ended December 31, 2022, 2021 and 2020 was $21 million, $25 million and $30 million, respectively.

Weighted average assumptions used to determine the fair value of ISOs granted using the Black-Scholes-Merton option pricing model are as follows:

Year ended December 31,	**2022**	2021	2020
Fair value per option *(Canadian dollars)*[1]	**5.07**	4.10	4.01
Valuation assumptions			
Expected option term *(years)*[2]	**6**	6	6
Expected volatility[3]	**21.9 %**	25.5 %	18.3 %
Expected dividend yield[4]	**6.5 %**	7.6 %	5.9 %
Risk-free interest rate[5]	**1.8 %**	0.7 %	1.3 %

1 Options granted to US employees are based on the New York Stock Exchange prices. The option value and assumptions shown are based on a weighted average of the US and the Canadian options. The fair values per option for the years ended December 31, 2022, 2021 and 2020 were $4.78, $3.91 and $3.75, respectively, for Canadian employees and US$4.62, US$3.65 and US$3.62, respectively, for US employees.
2 The expected option term is six years based on historical exercise practice and five years for retirement eligible employees.
3 Expected volatility is determined with reference to historic daily share price volatility and consideration of the implied volatility observable in call option values near the grant date.
4 The expected dividend yield is the current annual dividend at the grant date divided by the current stock price.
5 The risk-free interest rate is based on the Government of Canada's Canadian bond yields and the US Treasury bond yields.

Compensation expense recorded for the years ended December 31, 2022, 2021 and 2020 for ISOs was $15 million, $16 million and $24 million, respectively. As at December 31, 2022, unrecognized compensation expense related to non-vested stock-based compensation arrangements granted under the ISO Plan was $12 million. The expense is expected to be fully recognized over a weighted average period of approximately two years.

PERFORMANCE STOCK UNITS

Under PSU awards for certain key employees, cash awards are paid following a three-year performance cycle. Awards are calculated by multiplying the number of units outstanding at the end of the performance period by Enbridge's weighted average share price for 20 days prior to the maturity of the grant and by a performance multiplier. The performance multiplier ranges from zero, if our performance fails to meet threshold performance levels, to a maximum of 2.0 if we perform within the highest range of the performance targets. The performance multiplier is derived through a calculation of our Total Shareholder Return percentile rank, in each case relative to a specified peer group of companies and our distributable cash flow per share, adjusted for unusual, infrequent or other non-operating factors, relative to targets established at the time of grant. To calculate the 2022 expense, a multiplier of 1.25 was used for 2022 PSU grants, 1.25 for 2021 PSU grants and 2.00 for the 2020 PSU grants.

December 31, 2022	Number	Weighted Average Remaining Contractual Life *(years)*	Aggregate Intrinsic Value
(units in thousands; intrinsic value in millions of Canadian dollars)			
Units outstanding at beginning of year	**3,429**		
Units granted	**1,467**		
Units cancelled	**(131)**		
Units matured[1]	**(1,700)**		
Dividend reinvestment	**184**		
Units outstanding at end of year	**3,249**	**1.1**	**261**

1 The total amount paid during the years ended December 31, 2022, 2021 and 2020 for PSUs was $90 million, $70 million and $14 million, respectively.

Compensation expense recorded for the years ended December 31, 2022, 2021 and 2020 for PSUs was $169 million, $56 million and $76 million, respectively. As at December 31, 2022, unrecognized compensation expense related to non-vested PSUs was $72 million. The expense is expected to be fully recognized over a weighted average period of approximately two years.

RESTRICTED STOCK UNITS

Under RSU awards, cash awards are paid to certain of our employees vesting in equal installments on each of the first, second and third anniversaries of the grant date. Share-settled awards are given to certain senior management employees following a three year maturity period. RSU holders receive shares or cash equal to our weighted average share price for 20 days prior to the maturity of the grant multiplied by the units outstanding on the maturity date.

December 31, 2022	Number	Weighted Average Remaining Contractual Life *(years)*	Aggregate Intrinsic Value
(units in thousands; intrinsic value in millions of Canadian dollars)			
Units outstanding at beginning of year	**2,705**		
Units granted	**1,400**		
Units cancelled	**(134)**		
Units matured[1]	**(602)**		
Dividend reinvestment	**196**		
Units outstanding at end of year	**3,565**	**1.0**	**185**

1 The total amount paid during the years ended December 31, 2022, 2021 and 2020 for RSUs was $32 million, $72 million and $27 million, respectively.

Compensation expense recorded for the years ended December 31, 2022, 2021 and 2020 for RSUs was $76 million, $85 million and $44 million, respectively. As at December 31, 2022, unrecognized compensation expense related to non-vested RSUs was $35 million. The expense is expected to be fully recognized over a weighted average period of approximately two years.

23. COMPONENTS OF ACCUMULATED OTHER COMPREHENSIVE INCOME/(LOSS)

Changes in AOCI attributable to our common shareholders for the years ended December 31, 2022, 2021 and 2020 are as follows:

	Cash Flow Hedges	Excluded Components of Fair Value Hedges	Net Investment Hedges	Cumulative Translation Adjustment	Equity Investees	Pension and OPEB Adjustment	Total
(millions of Canadian dollars)

1 Reported within Interest expense in the Consolidated Statements of Earnings.
2 Reported within Transportation and other services revenues and Other income/(expense) in the Consolidated Statements of Earnings.
3 Reported within Operating and administrative expense in the Consolidated Statements of Earnings.
4 These components are included in the computation of net periodic benefit (credit)/cost and are reported within Other income/(expense) in the Consolidated Statements of Earnings.
5 Reported within Transportation and other services revenues, Commodity sales, Commodity costs and Operating and administrative expense in the Consolidated Statements of Earnings.

24. RISK MANAGEMENT AND FINANCIAL INSTRUMENTS

MARKET RISK

Our earnings, cash flows and OCI are subject to movements in foreign exchange rates, interest rates, commodity prices and our share price (collectively, market risks). Formal risk management policies, processes and systems have been designed to mitigate these risks.

The following summarizes the types of market risks to which we are exposed and the risk management instruments used to mitigate them. We use a combination of qualifying and non-qualifying derivative instruments to manage the risks noted below.

Foreign Exchange Risk

We generate certain revenues, incur expenses and hold a number of investments and subsidiaries that are denominated in currencies other than Canadian dollars. As a result, our earnings, cash flows and OCI are exposed to fluctuations resulting from foreign exchange rate variability.

We employ financial derivative instruments to hedge foreign currency denominated earnings exposure. A combination of qualifying cash flow, fair value and non-qualifying derivative instruments is used to hedge anticipated foreign currency denominated revenues and expenses and to manage variability in cash flows. We hedge certain net investments in US dollar-denominated investments and subsidiaries using foreign currency derivatives and US dollar-denominated debt.

Interest Rate Risk

Our earnings and cash flows are exposed to short-term interest rate variability due to the regular repricing of our variable rate debt, primarily commercial paper. We monitor our debt portfolio mix of fixed and variable rate debt instruments to manage a consolidated portfolio of floating rate debt within the Board of Directors approved policy limit of a maximum of 30% of floating rate debt as a percentage of total debt outstanding. We primarily use qualifying derivative instruments to manage interest rate risk. Pay fixed-receive floating interest rate swaps may be used to hedge against the effect of future interest rate movements. We have implemented a hedging program to partially mitigate the impact of short-term interest rate volatility on interest expense via execution of floating to fixed interest rate swaps. These hedges have an average fixed rate of 4.0%.

We are exposed to changes in the fair value of fixed rate debt that arise as a result of changes in market interest rates. Pay floating-receive fixed interest rate swaps are used, when applicable, to hedge against future changes to the fair value of fixed rate debt which mitigates the impact of fluctuations in fair value via execution of fixed to floating interest rate swaps. As at December 31, 2022, we do not have any pay floating-receive fixed interest rate swaps outstanding.

Our earnings and cash flows are also exposed to variability in longer term interest rates ahead of anticipated fixed rate term debt issuances. Forward starting interest rate swaps are used to hedge against the effect of future interest rate movements. We have established a program including some of our subsidiaries to partially mitigate our exposure to long-term interest rate variability on forecasted term debt issuances via execution of floating to fixed interest rate swaps with an average swap rate of 2.2%.

Commodity Price Risk

Our earnings and cash flows are exposed to changes in commodity prices as a result of our ownership interests in certain assets and investments, as well as through the activities of our energy services subsidiaries. These commodities include natural gas, crude oil, power and NGL. We employ financial and physical derivative instruments to fix a portion of the variable price exposures that arise from physical transactions involving these commodities. We use primarily non-qualifying derivative instruments to manage commodity price risk.

Equity Price Risk

Equity price risk is the risk of earnings fluctuations due to changes in our share price. We have exposure to our own common share price through the issuance of various forms of stock-based compensation, which affect earnings through revaluation of the outstanding units every period. We use equity derivatives to manage the earnings volatility derived from one form of stock-based compensation, restricted share units. We use a combination of qualifying and non-qualifying derivative instruments to manage equity price risk.

TOTAL DERIVATIVE INSTRUMENTS

We generally have a policy of entering into individual International Swaps and Derivatives Association, Inc. agreements, or other similar derivative agreements, with the majority of our financial derivative counterparties. These agreements provide for the net settlement of derivative instruments outstanding with specific counterparties in the event of bankruptcy or other significant credit events and reduce our credit risk exposure on financial derivative asset positions outstanding with the counterparties in those circumstances.

The following table summarizes the Consolidated Statements of Financial Position location and carrying value of our derivative instruments, as well as the maximum potential settlement amounts in the event of the specific circumstances described above. All amounts are presented gross in the Consolidated Statements of Financial Position.

December 31, 2022	Derivative Instruments Used as Cash Flow Hedges	Derivative Instruments Used as Fair Value Hedges	Non-Qualifying Derivative Instruments	Total Gross Derivative Instruments as Presented	Amounts Available for Offset	Total Net Derivative Instruments

1 *Total is an average net purchase/(sell) of power.*

Fair Value Derivatives

For foreign exchange derivative instruments that are designated and qualify as fair value hedges, the gain or loss on the derivative is included in Other income/(expense) or Interest expense in the Consolidated Statements of Earnings. The offsetting loss or gain on the hedged item attributable to the hedged risk is included in Other income/(expense) in the Consolidated Statements of Earnings. Any excluded components are included in the Consolidated Statements of Comprehensive Income.

Year ended December 31,	2022	2021
(millions of Canadian dollars)		
Unrealized gain on derivative	**262**	8
Unrealized loss on hedged item	**(254)**	(15)
Realized loss on derivative	**(110)**	(41)
Realized gain on hedged item	**85**	45

The Effect of Derivative Instruments on the Statements of Earnings and Comprehensive Income

The following table presents the effect of cash flow hedges and net investment hedges on our consolidated earnings and consolidated comprehensive income, before the effect of income taxes:

	2022	2021	2020
(millions of Canadian dollars)			
Amount of unrealized gain/(loss) recognized in OCI			
Cash flow hedges			
Foreign exchange contracts	**3**	(29)	(1)
Interest rate contracts	**1,151**	252	(595)
Commodity contracts	**(53)**	(28)	2
Other contracts	**(4)**	1	(3)
Fair value hedges			
Foreign exchange contracts	**(35)**	(5)	5
Net investment hedges			
Foreign exchange contracts	**—**	—	13
	1,062	191	(579)
Amount of (gain)/loss reclassified from AOCI to earnings			
Foreign exchange contracts[1]	**13**	5	5
Interest rate contracts[2]	**186**	296	253
Commodity contracts[3]	**—**	1	—
Other contracts[3]	**4**	2	(2)
	203	304	256

1 Reported within Transportation and other services revenues and Other income/(expense) in the Consolidated Statements of Earnings.
2 Reported within Interest expense in the Consolidated Statements of Earnings.
3 Reported within Operating and administrative expense in the Consolidated Statements of Earnings.

We estimate that a gain of $67 million from AOCI related to cash flow hedges will be reclassified to earnings in the next 12 months. Actual amounts reclassified to earnings depend on the foreign exchange rates, interest rates and commodity prices in effect when derivative contracts that are currently outstanding mature. For all forecasted transactions, the maximum term over which we are hedging exposures to the variability of cash flows is 36 months as at December 31, 2022.

Non-Qualifying Derivatives

The following table presents the unrealized gains and losses associated with changes in the fair value of our non-qualifying derivatives:

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Foreign exchange contracts[1]	**(1,344)**	92	902
Interest rate contracts[2]	**10**	2	(25)
Commodity contracts[3]	**50**	71	(114)
Other contracts[4]	**4**	8	(7)
Total unrealized derivative fair value gain/(loss), net	**(1,280)**	173	756

1 For the respective annual periods, reported within Transportation and other services revenue (2022 - $238 million loss; 2021 - $98 million gain; 2020 - $533 million gain) and Other income/(expense) (2022 - $1,106 million loss; 2021 - $6 million loss; 2020 - $369 million gain) in the Consolidated Statements of Earnings.
2 Reported as an increase within Interest expense in the Consolidated Statements of Earnings.
3 For the respective annual periods, reported within Transportation and other services revenue (2022 - $13 million gain; 2021 - $9 million gain; 2020 - $2 million loss), Commodity sales (2022 - $89 million gain; 2021 - $160 million gain; 2020 - $321 million loss), Commodity costs (2022 - $102 million loss; 2021 - $105 million loss; 2020 - $207 million gain) and Operating and administrative expense (2022 - $50 million gain; 2021 - $7 million gain; 2020 - $2 million gain) in the Consolidated Statements of Earnings.
4 Reported within Operating and administrative expense in the Consolidated Statements of Earnings.

LIQUIDITY RISK

Liquidity risk is the risk that we will not be able to meet our financial obligations, including commitments and guarantees, as they become due. In order to mitigate this risk, we forecast cash requirements over a 12-month rolling time period to determine whether sufficient funds will be available and maintain substantial capacity under our committed bank lines of credit to address any contingencies. Our primary sources of liquidity and capital resources are funds generated from operations, the issuance of commercial paper and draws under committed credit facilities and long-term debt, which includes debentures and medium-term notes. Our shelf prospectuses with securities regulators enable ready access to either the Canadian or US public capital markets, subject to market conditions. In addition, we maintain sufficient liquidity through committed credit facilities with a diversified group of banks and institutions which, if necessary, enables us to fund all anticipated requirements for approximately one year without accessing the capital markets. We are in compliance with all the terms and conditions of our committed credit facility agreements and term debt indentures as at December 31, 2022. As a result, all credit facilities are available to us and the banks are obligated to fund us under the terms of the facilities.

CREDIT RISK

Entering into derivative instruments may result in exposure to credit risk from the possibility that a counterparty will default on its contractual obligations. In order to mitigate this risk, we enter into risk management transactions primarily with institutions that possess strong investment grade credit ratings. Credit risk relating to derivative counterparties is mitigated through maintenance and monitoring of credit exposure limits and contractual requirements, netting arrangements, and ongoing monitoring of counterparty credit exposure using external credit rating services and other analytical tools.

We have credit concentrations and credit exposure, with respect to derivative instruments, in the following counterparty segments:

December 31,	**2022**	2021
(millions of Canadian dollars)		
Canadian financial institutions	**644**	424
US financial institutions	**277**	130
European financial institutions	**334**	181
Asian financial institutions	**224**	30
Other[1]	**105**	122
	1,584	887

1 Other is comprised of commodity clearing house and physical natural gas and crude oil counterparties.

As at December 31, 2022, we did not provide any letters of credit in lieu of providing cash collateral to our counterparties pursuant to the terms of the relevant International Swaps and Derivatives Association agreements. We held no cash collateral on derivative asset exposures as at December 31, 2022 and December 31, 2021.

Gross derivative balances have been presented without the effects of collateral posted. Derivative assets are adjusted for non-performance risk of our counterparties using their credit default swap spread rates, and are reflected at fair value. For derivative liabilities, our non-performance risk is considered in the valuation.

Credit risk also arises from trade and other long-term receivables, and is mitigated through credit exposure limits and contractual requirements, assessment of credit ratings and netting arrangements. Within Enbridge Gas, credit risk is mitigated by the utility's large and diversified customer base and the ability to recover an estimate for expected credit losses through the ratemaking process. We actively monitor the financial strength of large industrial customers and, in select cases, have obtained additional security to minimize the risk of default on receivables. Generally, we utilize a loss allowance matrix which contemplates historical credit losses by age of receivables, adjusted for any forward-looking information and management expectations to measure lifetime expected credit losses of receivables. The maximum exposure to credit risk related to non-derivative financial assets is their carrying value.

FAIR VALUE MEASUREMENTS

Our financial assets and liabilities measured at fair value on a recurring basis include derivative instruments. We also disclose the fair value of other financial instruments not measured at fair value. The fair value of financial instruments reflects our best estimates of market value based on generally accepted valuation techniques or models and is supported by observable market prices and rates. When such values are not available, we use discounted cash flow analysis from applicable yield curves based on observable market inputs to estimate fair value.

FAIR VALUE OF FINANCIAL INSTRUMENTS

We categorize our financial instruments measured at fair value into one of three different levels depending on the observability of the inputs employed in the measurement.

Level 1

Level 1 includes financial instruments measured at fair value based on unadjusted quoted prices for identical assets and liabilities in active markets that are accessible at the measurement date. An active market for a financial instrument is considered to be a market where transactions occur with sufficient frequency and volume to provide pricing information on an ongoing basis. Our Level 1 instruments consist primarily of exchange-traded derivatives used to mitigate the risk of crude oil price fluctuations, US and Canadian treasury bills, investments in exchange-traded equity funds held by our captive insurance subsidiaries, as well as restricted long-term investments in Canadian equity securities that are held in trust in accordance with the CER's regulatory requirements under the LMCI.

Level 2

Level 2 includes financial instrument valuations determined using directly or indirectly observable inputs other than quoted prices included within Level 1. Financial instruments in this category are valued using models or other industry standard valuation techniques derived from observable market data. Such valuation techniques include inputs such as quoted forward prices, time value, volatility factors and broker quotes that can be observed or corroborated in the market for the entire duration of the financial instrument. Derivatives valued using Level 2 inputs include non-exchange traded derivatives such as over-the-counter foreign exchange forward and cross currency swap contracts, interest rate swaps, physical forward commodity contracts, as well as commodity swaps and options for which observable inputs can be obtained.

We have also categorized the fair value of our long-term debt, investments in debt securities held by our captive insurance subsidiaries, and restricted long-term investments in Canadian government bonds held in accordance with the CER's regulatory requirements under the LMCI as Level 2. The fair value of our long-term debt is based on quoted market prices for instruments of similar yield, credit risk and tenor. When possible, the fair value of our restricted long-term investments is based on quoted market prices for similar instruments and, if not available, based on broker quotes.

Level 3

Level 3 includes derivative valuations based on inputs which are less observable, unavailable or where the observable data does not support a significant portion of the derivatives' fair value. Generally, Level 3 derivatives are longer dated transactions, occur in less active markets, occur at locations where pricing information is not available or have no binding broker quote to support Level 2 classification. We have developed methodologies, benchmarked against industry standards, to determine fair value for these derivatives based on extrapolation of observable future prices and rates. Derivatives valued using Level 3 inputs primarily include long-dated derivative power, NGL and natural gas contracts, basis swaps, commodity swaps, and power and energy swaps, as well as physical forward commodity contracts. We do not have any other financial instruments categorized in Level 3.

We use the most observable inputs available to estimate the fair value of our derivatives. When possible, we estimate the fair value of our derivatives based on quoted market prices. If quoted market prices are not available, we use estimates from third party brokers. For non-exchange traded derivatives classified in Levels 2 and 3, we use standard valuation techniques to calculate the estimated fair value. These methods include discounted cash flows for forwards and swaps and Black-Scholes-Merton pricing models for options. Depending on the type of derivative and nature of the underlying risk, we use observable market prices (interest, foreign exchange, commodity and share price) and volatility as primary inputs to these valuation techniques. Finally, we consider our own credit default swap spread as well as the credit default swap spreads associated with our counterparties in our estimation of fair value.

We have categorized our derivative assets and liabilities measured at fair value as follows:

December 31, 2022	Level 1	Level 2	Level 3	Total Gross Derivative Instruments
(millions of Canadian dollars)				
Financial assets				
Current derivative assets				
Foreign exchange contracts	**—**	**46**	**—**	**46**

Commodity contracts	(52)	(66)	(146)	(264)
	(52)	(519)	(146)	(717)
Long-term derivative liabilities				
Foreign exchange contracts	—	(423)	—	(423)
Interest rate contracts	—	(24)	—	(24)
Commodity contracts	—	(19)	(65)	(84)
	—	(466)	(65)	(531)
Total net financial asset/(liability)				
Foreign exchange contracts	—	(227)	—	(227)
Interest rate contracts	—	(22)	—	(22)
Commodity contracts	(14)	7	(108)	(115)
Other contracts	—	5	—	5
	(14)	(237)	(108)	(359)

The significant unobservable inputs used in the fair value measurement of Level 3 derivative instruments were as follows:

December 31, 2022	Fair Value	Unobservable Input	Minimum Price	Maximum Price	Weighted Average Price	Unit of Measurement
(fair value in millions of Canadian dollars)						
Commodity contracts - financial[1]						
Natural gas	**(35)**	**Forward gas price**	**4.57**	**34.56**	**6.25**	**$/mmbtu[2]**
Crude	**(4)**	**Forward crude price**	**71.10**	**105.22**	**83.26**	**$/barrel**
Power	**(71)**	**Forward power price**	**36.63**	**364.00**	**103.30**	**$/MW/H**
Commodity contracts - physical[1]						
Natural gas	**(41)**	**Forward gas price**	**1.67**	**33.89**	**6.00**	**$/mmbtu[2]**
Crude	**(2)**	**Forward crude price**	**64.43**	**116.60**	**86.25**	**$/barrel**
Power	**17**	**Forward power price**	**30.49**	**183.88**	**72.48**	**$/MW/H**
	(136)					

1 Financial and physical forward commodity contracts are valued using a market approach valuation technique.
2 One million British thermal units (mmbtu).

If adjusted, the significant unobservable inputs disclosed in the table above would have a direct impact on the fair value of our Level 3 derivative instruments. The significant unobservable inputs used in the fair value measurement of Level 3 derivative instruments include forward commodity prices. Changes in forward commodity prices could result in significantly different fair values for our Level 3 derivatives.

Changes in net fair value of derivative assets and liabilities classified as Level 3 in the fair value hierarchy were as follows:

Year ended December 31,	**2022**	2021
(millions of Canadian dollars)		
Level 3 net derivative liability at beginning of period	**(108)**	(191)
Total gain/(loss)		
Included in earnings[1]	**6**	(39)
Included in OCI	**(54)**	(29)
Settlements	**20**	151
Level 3 net derivative liability at end of period	**(136)**	(108)

1 Reported within Transportation and other services revenues, Commodity costs and Operating and administrative expense in the Consolidated Statements of Earnings.

There were no transfers into or out of Level 3 as at December 31, 2022 or 2021.

NET INVESTMENT HEDGES

We currently have designated a portion of our US dollar-denominated debt as a hedge of our net investment in US dollar-denominated investments and subsidiaries.

During the years ended December 31, 2022 and 2021, we recognized an unrealized foreign exchange loss of $954 million and gain of $49 million, respectively, on the translation of US dollar-denominated debt, in OCI. No unrealized gains or losses on the change in fair value of our outstanding foreign exchange forward contracts were recognized in OCI during the years ended December 31, 2022 and 2021. No realized gains or losses associated with the settlement of foreign exchange forward contracts were recognized in OCI during the years ended December 31, 2022 and 2021. During the years ended December 31, 2022 and 2021, we recognized a realized loss of $21 million and nil, respectively, associated with the settlement of US dollar-denominated debt that had matured during the period, in OCI.

FAIR VALUE OF OTHER FINANCIAL INSTRUMENTS

Certain long-term investments in other entities with no actively quoted prices are classified as FVMA investments and are recorded at cost less impairment. The carrying value of FVMA investments totaled $102 million and $52 million as at December 31, 2022 and 2021, respectively.

As at December 31, 2022, the fair value of short- and long-term investments in equity funds and debt securities held by our captive insurance subsidiaries was $145 million and $488 million, respectively (2021 - $14 million and $290 million, respectively). These investments in equity funds and debt securities are recognized at fair value, classified as Level 1 and Level 2 in the fair value hierarchy, and are recorded in Accounts receivable and other and Long-term investments, respectively, in the Consolidated Statements of Financial Position. There were unrealized holding losses in equity funds and debt securities of $26 million for the year ended December 31, 2022 (2021 - losses of $12 million).

As at December 31, 2022 and 2021, our long-term debt had a carrying value of $79.3 billion and $74.4 billion, respectively, before debt issuance costs and a fair value of $73.5 billion and $82.0 billion, respectively. We also have non-current notes receivable carried at book value and recorded in Deferred amounts and other assets in the Consolidated Statements of Financial Position. As at December 31, 2022 and 2021, the non-current notes receivable had a carrying value of $752 million and $954 million, respectively, which also approximates their fair value.

The fair value of financial assets and liabilities other than derivative instruments, long-term investments, restricted long-term investments, long-term debt and non-current notes receivable described above approximate their carrying value due to the short period to maturity.

25. INCOME TAXES

INCOME TAX RATE RECONCILIATION

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Earnings before income taxes	**4,542**	7,729	4,190
Canadian federal statutory income tax rate	**15 %**	15 %	15 %
Expected federal taxes at statutory rate	**681**	1,159	629
Increase/(decrease) resulting from:			
Provincial and state income taxes[1]	**108**	228	288
Foreign and other statutory rate differentials[2]	**295**	134	(53)
Effects of rate-regulated accounting[3]	**(122)**	(139)	(145)
Foreign allowable interest deductions	**—**	—	(4)
Part VI.1 tax, net of federal Part I deduction[4]	**76**	73	76
US Minimum Tax[5]	**107**	—	44
Non-taxable portion of gain on sale of investment[6]	**—**	(23)	—
Valuation allowance	**6**	5	(6)
Accounting impairment of non-deductible goodwill[7]	**370**	—	—
Noncontrolling interests[8]	**9**	(17)	(8)
Other[9]	**74**	(5)	(47)
Income tax expense	**1,604**	1,415	774
Effective income tax rate	**35.3 %**	18.3 %	18.5 %

1 *The change in provincial and state income taxes from 2021 to 2022 reflects the decrease in earnings from Canadian operations and the effect of the reduction in the Pennsylvania corporate income tax rate in the US, partially offset by the increase in earnings from US operations before the non-deductible goodwill impairment relating to the Gas Transmission reporting unit in combination with state tax apportionment changes. Refer to* Note 16 - Goodwill.
2 *The change in foreign and other statutory rate differentials from 2021 to 2022 reflects the increase in earnings from US operations, before the goodwill impairment relating to the Gas Transmission reporting unit. Refer to* Note 16 - Goodwill.
3 *The amount in 2022 relates to the federal component of the tax impact relating to the 2022 variable consideration attributable to the Canadian Mainline. Refer to* Note 4 - Revenue.
4 *Part VI.1 tax is a tax levied on preferred share dividends paid in Canada.*
5 *There was no US Minimum Tax in 2021 as a result of tax losses from bonus tax depreciation.*
6 *The amount in 2021 relates to the federal impact of the gain on sale of the investment in Noverco.*
7 *The amount in 2022 relates to the federal impact of the non-deductible goodwill impairment relating to the Gas Transmission reporting unit. Refer to* Note 16 - Goodwill.
8 *The amount in 2022 includes the federal tax impact of an impairment to Magic Valley attributable to noncontrolling interests. Refer to* Note 11 - Property, Plant and Equipment.
9 *The amount in 2022 includes the federal component of the tax impact relating to the 2021 variable consideration attributable to the Canadian Mainline. Refer to* Note 4 - Revenue.

COMPONENTS OF PRETAX EARNINGS AND INCOME TAXES

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Earnings before income taxes			
Canada	**583**	3,399	2,789
US	**2,865**	3,336	407
Other	**1,094**	994	994
	4,542	7,729	4,190
Current income taxes			
Canada	**360**	162	165
US	**201**	80	64
Other	**86**	82	98
	647	324	327
Deferred income taxes			
Canada	**(358)**	344	378
US	**1,309**	741	66
Other	**6**	6	3
	957	1,091	447
Income tax expense	**1,604**	1,415	774

COMPONENTS OF DEFERRED INCOME TAXES

Deferred income tax assets and liabilities are recognized for the future tax consequences of differences between carrying amounts of assets and liabilities and their respective tax bases. Major components of deferred income tax assets and liabilities are as follows:

December 31,	**2022**	2021
(millions of Canadian dollars)		
Deferred income tax liabilities		
Property, plant and equipment	**(9,096)**	(8,721)
Investments	**(7,099)**	(6,097)
Regulatory assets	**(1,291)**	(1,245)
Pension and OPEB plans	**(30)**	—
Other	**(46)**	(208)
Total deferred income tax liabilities	**(17,562)**	(16,271)
Deferred income tax assets		
Financial instruments	**456**	315
Pension and OPEB plans	**—**	110
Loss carryforwards	**2,259**	3,081
Other	**1,753**	1,648
Total deferred income tax assets	**4,468**	5,154
Less valuation allowance	**(215)**	(84)
Total deferred income tax assets, net	**4,253**	5,070
Net deferred income tax liabilities	**(13,309)**	(11,201)
Presented as follows:		
Total deferred income tax assets	**472**	488
Total deferred income tax liabilities	**(13,781)**	(11,689)
Net deferred income tax liabilities	**(13,309)**	(11,201)

A valuation allowance has been established for certain loss and credit carryforwards, and outside basis temporary differences on investments that reduce deferred income tax assets to an amount that will more likely than not be realized.

As at December 31, 2022, we recognized the benefit of unused tax loss carryforwards of $2.1 billion (2021 - $1.9 billion) in Canada which expire in 2030 and beyond.

As at December 31, 2022, we recognized the benefit of unused tax loss carryforwards of $8.1 billion (2021 - $11.0 billion) in the US. Unused tax loss carryforwards of $0.2 billion (2021 - $3.5 billion) begin to expire in 2023, and unused tax loss carryforwards of $7.9 billion (2021 - $7.5 billion) have no expiration.

We have not provided for deferred income taxes on the difference between the carrying value of substantially all of our foreign subsidiaries and their corresponding tax basis as the earnings of those subsidiaries are intended to be permanently reinvested in their operations. As such, these investments are not anticipated to give rise to income taxes in the foreseeable future. The difference between the carrying values of the investments and their tax bases is largely a result of unremitted earnings and currency translation adjustments. The unremitted earnings and currency translation adjustment for which no deferred taxes have been recognized in respect of foreign subsidiaries were $8.0 billion and $4.3 billion for the periods ended December 31, 2022 and 2021, respectively. If such earnings are remitted, in the form of dividends or otherwise, we may be subject to income taxes and foreign withholding taxes. The determination of the amount of unrecognized deferred income tax liabilities applicable to such amounts is not practicable.

Enbridge and certain of our subsidiaries are subject to taxation in Canada, the US and other foreign jurisdictions. The material jurisdictions in which we are subject to potential examinations include the US (Federal) and Canada (Federal, Alberta and Québec). We are open to examination by Canadian tax authorities for the 2015 to 2022 tax years and by US tax authorities for the 2019 to 2022 tax years. We are currently under examination for income tax matters in Canada for the 2016 to 2019 tax years. We are not currently under examination for income tax matters in any other material jurisdiction where we are subject to income tax.

UNRECOGNIZED TAX BENEFITS

Year ended December 31,	**2022**	2021
(millions of Canadian dollars)		
Unrecognized tax benefits at beginning of year	**76**	121
Gross increases for tax positions of current year	**—**	1
Gross decreases for tax positions of prior year	**(17)**	(26)
Change in translation of foreign currency	**1**	(1)
Lapses of statute of limitations	**(5)**	(19)
Unrecognized tax benefits at end of year	**55**	76

The unrecognized tax benefits as at December 31, 2022, if recognized, would impact our effective income tax rate. We do not anticipate further adjustments to the unrecognized tax benefits during the next 12 months that would have a material impact on our consolidated financial statements.

We recognize accrued interest and penalties related to unrecognized tax benefits as a component of income taxes. Interest and penalties included in income taxes for the years ended December 31, 2022 and 2021 were a $1 million expense and $5 million recovery, respectively. As at December 31, 2022 and 2021, interest and penalties of $13 million and $12 million, respectively, have been accrued.

26. PENSION AND OTHER POSTRETIREMENT BENEFITS

PENSION PLANS

We sponsor Canadian and US contributory and non-contributory registered defined benefit and defined contribution pension plans, which provide benefits covering substantially all employees. The Canadian pension plans provide defined benefit and defined contribution pension benefits to our Canadian employees. The US pension plans provide defined benefit pension benefits to our US employees. We also sponsor supplemental non-contributory defined benefit pension plans, which provide non-registered benefits for certain employees in Canada and the US.

Defined Benefit Pension Plan Benefits

Benefits payable from the defined benefit pension plans are based on each plan participant's years of service and final average remuneration. Some benefits are partially inflation-indexed after a plan participant's retirement. Our contributions are made in accordance with independent actuarial valuations. Participant contributions to contributory defined benefit pension plans are based upon each plan participant's current eligible remuneration.

Defined Contribution Pension Plan Benefits

Our contributions are based on each plan participant's current eligible remuneration. Our contributions for some defined contribution pension plans are also based on age and years of service. Our defined contribution pension benefit costs are equal to the amount of contributions required to be made by us.

Benefit Obligations, Plan Assets and Funded Status

The following table details the changes in the projected benefit obligation, the fair value of plan assets and the recorded assets or liabilities for our defined benefit pension plans:

	Canada		US	
December 31,	**2022**	2021	**2022**	2021
(millions of Canadian dollars)				
Change in projected benefit obligation				
Projected benefit obligation at beginning of year	**4,600**	4,855	**1,184**	1,243
Service cost	**131**	139	**43**	44
Interest cost	**127**	101	**24**	17
Participant contributions	**29**	28	**—**	—
Actuarial gain[1]	**(1,069)**	(329)	**(201)**	(21)
Benefits paid	**(187)**	(194)	**(94)**	(84)
Foreign currency exchange rate changes	**—**	—	**77**	(11)
Other	**(1)**	—	**(4)**	(4)
Projected benefit obligation at end of year[2]	**3,630**	4,600	**1,029**	1,184
Change in plan assets				
Fair value of plan assets at beginning of year	**4,536**	4,077	**1,160**	1,062
Actual return/(loss) on plan assets	**(235)**	505	**(64)**	151
Employer contributions[3]	**91**	120	**4**	43
Participant contributions	**29**	28	**—**	—
Benefits paid	**(187)**	(194)	**(94)**	(84)

Other	**—**	—	**(4)**	(4)
Fair value of plan assets at end of year[4]	**4,234**	4,536	**1,080**	1,160
Overfunded/(underfunded) status at end of year	**604**	(64)	**51**	(24)
Presented as follows:				
Deferred amounts and other assets	**764**	250	**141**	98
Accounts payable and other	**(9)**	(9)	**(5)**	(4)
Other long-term liabilities	**(151)**	(305)	**(85)**	(118)
	604	(64)	**51**	(24)

1 Actuarial gains in 2022 and 2021 primarily due to increase in the discount rates used to measure the benefit obligations.

2 The accumulated benefit obligation for our Canadian pension plans was $3.4 billion and $4.3 billion as at December 31, 2022 and 2021, respectively. The accumulated benefit obligation for our US pension plans was $1.0 billion and $1.1 billion as at December 31, 2022 and 2021, respectively.

3 Lower employer contributions in 2022 compared to 2021 primarily due to more plans in an overfunded status.

4 Assets in the amount of $10 million (2021 - $13 million) and $58 million (2021 - $84 million), related to our Canadian and US non-registered supplemental pension plan obligations, are held in grantor trusts and rabbi trusts that, in accordance with federal tax regulations, are not restricted from creditors. These assets are committed for the future settlement of benefit obligations included in the underfunded status as at the end of the year, however they are excluded from plan assets for accounting purposes.

Certain of our pension plans have accumulated benefit obligations in excess of the fair value of plan assets. For these plans, the accumulated benefit obligation and fair value of plan assets were as follows:

	Canada		US	
December 31,	**2022**	2021	**2022**	2021
(millions of Canadian dollars)				
Accumulated benefit obligation	**360**	440	**89**	115
Fair value of plan assets	**218**	247	**—**	—

Certain of our pension plans have projected benefit obligations in excess of the fair value of plan assets. For these plans, the projected benefit obligation and fair value of plan assets were as follows:

	Canada		US	
December 31,	**2021**	2020	**2021**	2020
(millions of Canadian dollars)				
Projected benefit obligation	**377**	1,272	**90**	121
Fair value of plan assets	**218**	1,020	**—**	—

Amount Recognized in Accumulated Other Comprehensive Income
The amount of pre-tax AOCI relating to our pension plans are as follows:

	Canada		US	
December 31,	**2022**	2021	**2022**	2021
(millions of Canadian dollars)				
Net actuarial (gain)/loss	**(64)**	226	**40**	92
Prior service (credit)/cost	**—**	—	**1**	(1)
Total amount recognized in AOCI[1]	**(64)**	226	**41**	91

1 Excludes amounts related to CTA.

Net Periodic Benefit Cost and Other Amounts Recognized in Comprehensive Income
The components of net periodic benefit cost and other amounts recognized in pre-tax Comprehensive income related to our pension plans are as follows:

	Canada			US		
Year ended December 31,	**2022**	2021	2020	**2022**	2021	2020
(millions of Canadian dollars)						
Service cost	**131**	139	148	**43**	44	44
Interest cost[1]	**127**	101	128	**24**	17	31
Expected return on plan assets[1]	**(295)**	(252)	(260)	**(85)**	(73)	(88)
Amortization/settlement of net actuarial loss[1]	**8**	54	42	**—**	11	1

Net periodic benefit (credit)/cost	**(29)**	42	58	**(20)**	(1)	(13)
Defined contribution benefit cost	**10**	7	6	**—**	—	—
Net pension (credit)/cost recognized in Earnings	**(19)**	49	64	**(20)**	(1)	(13)
Amount recognized in OCI:						
Amortization/settlement of net actuarial loss	**(2)**	(25)	(21)	**—**	(11)	(1)
Amortization/curtailment of prior service credit	**—**	—	—	**2**	—	1
Net actuarial (gain)/loss arising during the year	**(288)**	(291)	118	**(52)**	(99)	100
Total amount recognized in OCI	**(290)**	(316)	97	**(50)**	(110)	100
Total amount recognized in Comprehensive income	**(309)**	(267)	161	**(70)**	(111)	87

1 Reported within Other income/(expense) in the Consolidated Statements of Earnings.

Actuarial Assumptions
The weighted average assumptions made in the measurement of the projected benefit obligation and net periodic benefit cost of our pension plans are as follows:

	Canada			US		
	2022	2021	2020	**2022**	2021	2020
Projected benefit obligation						
Discount rate	**5.1 %**	3.2 %	2.6 %	**4.9 %**	2.6 %	2.2 %
Rate of salary increase	**2.9 %**	2.9 %	2.3 %	**2.8 %**	2.8 %	2.7 %
Cash balance interest credit rate	**N/A**	N/A	N/A	**4.3 %**	4.3 %	4.3 %
Net periodic benefit cost						
Discount rate	**3.2 %**	2.6 %	3.0 %	**2.6 %**	2.2 %	3.0 %
Rate of return on plan assets	**6.6 %**	6.2 %	6.8 %	**7.4 %**	7.3 %	7.9 %
Rate of salary increase	**2.9 %**	2.3 %	3.2 %	**2.8 %**	2.7 %	2.9 %
Cash balance interest credit rate	**N/A**	N/A	N/A	**4.3 %**	4.3 %	4.5 %

OTHER POSTRETIREMENT BENEFIT PLANS
We sponsor funded and unfunded defined benefit OPEB Plans, which provide non-contributory supplemental health, dental, life and health spending account benefit coverage for certain qualifying retired employees.

Benefit Obligations, Plan Assets and Funded Status
The following table details the changes in the accumulated postretirement benefit obligation, the fair value of plan assets and the recorded assets or liabilities for our defined benefit OPEB plans:

	Canada		US	
December 31,	**2022**	2021	**2022**	2021
(millions of Canadian dollars)				
Change in accumulated postretirement benefit obligation				
Accumulated postretirement benefit obligation at beginning of year	**274**	321	**173**	254
Service cost	**4**	6	**1**	1
Interest cost	**7**	7	**3**	3
Participant contributions	**—**	—	**6**	8
Actuarial gain[1]	**(66)**	(51)	**(37)**	(69)
Benefits paid	**(8)**	(9)	**(21)**	(22)

Total amount recognized in Comprehensive income	**(56)**	(37)	34	**(12)**	(86)	(21)

1 Reported within Other income/(expense) in the Consolidated Statements of Earnings.

The weighted average assumptions made in the measurement of the accumulated postretirement benefit obligation and net periodic benefit cost of our OPEB plans are as follows:

	Canada			US		
	2022	2021	2020	**2022**	2021	2020
Accumulated postretirement benefit obligation						
Discount rate	**5.3 %**	3.2 %	2.6 %	**4.9 %**	2.4 %	2.0 %
Net periodic benefit cost						
Discount rate	**3.2 %**	2.6 %	3.1 %	**2.4 %**	2.0 %	2.8 %
Rate of return on plan assets	**N/A**	N/A	N/A	**6.0 %**	6.0 %	6.7 %

Assumed Health Care Cost Trend Rates
The assumed rates for the next year used to measure the expected cost of benefits are as follows:

	Canada		US[1]	
	2022	2021	**2022**	2021
Health care cost trend rate assumed for next year	**4.0 %**	4.0 %	**4.7 %**	7.0 %
Rate to which the cost trend is assumed to decline (ultimate trend rate)	**4.0 %**	4.0 %	**3.3 %**	4.5 %
Year that the rate reaches the ultimate trend rate	**N/A**	N/A	**2021 - 2045**	2037

1 In addition, under the Enbridge Employee Services, Inc., Health Reimbursement Account Plan, health care costs will increase by 5.0% every three years.

PLAN ASSETS
We manage the investment risk of our pension funds by setting a long-term asset mix policy for each plan after consideration of: (i) the nature of pension plan liabilities; (ii) the investment horizon of the plan; (iii) the going concern and solvency funded status and cash flow requirements of the plan; (iv) our operating environment and financial situation and our ability to withstand fluctuations in pension contributions; and (v) the future economic and capital markets outlook with respect to investment returns, volatility of returns and correlation between assets.

The overall expected rate of return on plan assets is based on the asset allocation targets with estimates for returns based on long-term expectations.

The asset allocation targets and major categories of plan assets are as follows:

	Canada			US		
	Target	December 31,		**Target**	December 31,	
Asset Category	**Allocation**	**2022**	2021	**Allocation**	**2022**	2021
Equity securities	**43.8 %**	**38.2 %**	46.7 %	**45.0 %**	**38.3 %**	52.5 %
Fixed income securities	**28.4 %**	**31.7 %**	29.8 %	**20.0 %**	**20.5 %**	18.4 %
Alternatives[1]	**27.8 %**	**30.1 %**	23.5 %	**35.0 %**	**41.2 %**	29.1 %

1 Alternatives include investments in private debt, private equity, infrastructure and real estate funds. Fund values are based on the net asset value of the funds that invest directly in the aforementioned underlying investments. The values of the investments have been estimated using the capital accounts representing the plan's ownership interest in the funds.

Pension Plans

The following table summarizes the fair value of plan assets for our pension plans recorded at each fair value hierarchy level:

	Canada				US			
	Level 1[1]	Level 2[2]	Level 3[3]	Total	Level 1[1]	Level 2[2]	Level 3[3]	Total

Year ending December 31,	2023	2024	2025	2026	2027	2028-2032
(millions of Canadian dollars)						
Pension						
Canada	204	210	216	221	226	1,208
US	88	87	87	88	90	424
OPEB						
Canada	12	12	13	13	13	68
US	16	15	14	13	12	49

EXPECTED EMPLOYER CONTRIBUTIONS
In 2023, we expect to contribute approximately $29 million and $5 million to the Canadian and US pension plans, respectively, and $12 million and $6 million to the Canadian and US OPEB plans, respectively.

RETIREMENT SAVINGS PLANS
In addition to the pension and OPEB plans discussed above, we also have defined contribution employee savings plans available to US employees. Employees may participate in a matching contribution where we match a certain percentage of before-tax employee contributions of up to 6.0% of eligible pay per pay period. For the year ended December 31, 2022, pre-tax employer matching contribution costs were $30 million ($27 million in each of 2021 and 2020).

27. LEASES

LESSEE
We incur operating lease expenses related primarily to real estate, pipelines, storage and equipment. Our operating leases have remaining lease terms of 1 month to 24 years as at December 31, 2022.

For the years ended December 31, 2022, 2021 and 2020, we incurred operating lease expenses of $118 million, $95 million and $107 million, respectively. Operating lease expenses are reported under Operating and administrative expense in the Consolidated Statements of Earnings.

For the years ended December 31, 2022, 2021 and 2020, operating lease payments to settle lease liabilities were $123 million, $118 million and $133 million, respectively. Operating lease payments are reported under Operating activities in the Consolidated Statements of Cash Flows.

Supplemental Statements of Financial Position Information

(millions of Canadian dollars, except lease term and discount rate)	**December 31, 2022**	December 31, 2021

Variable lease income	**321**	333	361
Total lease income[1]	**587**	596	626

1 Lease income is recorded under Transportation and other services in the Consolidated Statements of Earnings.

As at December 31, 2022, our future lease payments to be received under operating lease contracts where we are the lessor are as follows:

	Operating leases
(millions of Canadian dollars)	
2023	**227**
2024	**215**
2025	**204**
2026	**198**
2027	**201**
Thereafter	**1,832**
Future lease payments	**2,877**

28. OTHER INCOME/(EXPENSE)

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Gain/(loss) on dispositions	**(12)**	319	(17)
Realized foreign currency gain/(loss)	**92**	126	(10)
Unrealized foreign currency gain/(loss)	**(1,094)**	160	191
Net defined pension and OPEB credit	**239**	150	148
Other	**186**	224	(74)
	(589)	979	238

29. CHANGES IN OPERATING ASSETS AND LIABILITIES

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Accounts receivable and other	**(967)**	(1,228)	1,546
Accounts receivable from affiliates	**17**	(38)	8
Inventory	**(599)**	(118)	(254)
Deferred amounts and other assets	**1**	(195)	(586)
Accounts payable and other	**1,100**	87	(770)
Accounts payable to affiliates	**16**	52	1
Interest payable	**58**	43	31
Other long-term liabilities	**362**	(69)	117
	(12)	(1,466)	93

30. RELATED PARTY TRANSACTIONS

Related party transactions are conducted in the normal course of business and, unless otherwise noted, are measured at the exchange amount, which is the amount of consideration established and agreed to by the related parties.

We provide transportation services to several significantly influenced investees which we record as transportation and other services revenue. We also purchase and sell natural gas and crude oil with several of our significantly influenced investees. These revenues and costs are recorded as commodity sales and commodity costs. We contract for firm transportation services to meet our annual natural gas supply requirements which we record as gas distribution costs.

Our transactions with significantly influenced investees are as follows:

Year ended December 31,	**2022**	2021	2020
(millions of Canadian dollars)			
Transportation and other revenues	**185**	237	219
Commodity sales	**51**	20	21
Operating and administrative[1]	**503**	380	338
Commodity costs[2]	**778**	790	518
Gas distribution costs	**136**	131	135

1 *During the years ended December 31, 2022, 2021 and 2020, we had Operating and administrative costs from the Seaway Crude Pipeline System of $495 million, $389 million and $342 million, respectively. These costs are a result of an operational contract where we utilize capacity on Seaway Crude Pipeline System assets for use in our Liquids Pipelines business.*

2 *During the years ended December 31, 2022, 2021 and 2020, we had Commodity costs from Aux Sable Canada LP of $571 million, $447 million and $91 million, respectively.*

LONG-TERM NOTES RECEIVABLE FROM AFFILIATES

As at December 31, 2022, amounts receivable from affiliates include a series of loans totaling $752 million (2021 - $954 million), which require quarterly or semi-annual interest payments at annual interest rates ranging from 3% to 8%. Interest income recognized from these notes totaled $30 million, $39 million and $44 million for the years ended December 31, 2022, 2021 and 2020, respectively. The amounts receivable from affiliates are included in Deferred amounts and other assets in the Consolidated Statements of Financial position.

31. COMMITMENTS AND CONTINGENCIES

COMMITMENTS

As at December 31, 2022, we have commitments as detailed below:

	Total	Less than 1 year	2 years	3 years	4 years	5 years	Thereafter
(millions of Canadian dollars)							
Annual debt maturities[1]	78,742	6,024	8,220	6,051	3,730	10,344	44,373
Purchase of services, pipe and other materials, including transportation[2]	10,661	3,553	1,513	1,070	1,001	767	2,757
Maintenance agreements[3]	536	53	53	53	53	55	269
Right-of-ways commitments	1,474	45	45	46	46	46	1,246
Total	91,413	9,675	9,831	7,220	4,830	11,212	48,645

1 Includes debentures, term notes, commercial paper and credit facility draws based on the facility's maturity date and excludes short-term borrowings, debt discounts, debt issuance costs, finance lease obligations and fair value adjustment. We have the ability under certain debt facilities to call and repay the obligations prior to scheduled maturities. Therefore, the actual timing of future cash repayments could be materially different than presented above.

2 Includes capital and operating commitments. Consists primarily of firm capacity payments that provide us with uninterrupted firm access to natural gas and crude oil transportation and storage contracts; contractual obligations to purchase physical quantities of natural gas; and power commitments.

3 Consists primarily of maintenance service contracts for our wind and solar assets.

ENVIRONMENTAL

We are subject to various Canadian and US federal, provincial/state and local laws relating to the protection of the environment. These laws and regulations can change from time to time, imposing new obligations on us.

Environmental risk is inherent to liquid hydrocarbon and natural gas pipeline operations, and Enbridge and its affiliates are, at times, subject to environmental remediation obligations at various sites where we operate. We manage this environmental risk through appropriate environmental policies, programs and practices to minimize any impact our operations may have on the environment. To the extent that we are unable to recover payment for environmental liabilities from insurance or other potentially responsible parties, we will be responsible for payment of costs arising from environmental incidents associated with our operating activities.

AUX SABLE

On October 14, 2016, an amended claim was filed against Aux Sable by a counterparty to an NGL supply agreement. On January 5, 2017, Aux Sable filed a Statement of Defence with respect to this claim.

On November 27, 2019, the counterparty filed an amended amended claim providing further particulars of its claim against Aux Sable, increasing its damages claimed, and adding defendants Aux Sable Liquid Products Inc. and Aux Sable Extraction LLC (general partners of the previously existing defendants). Aux Sable filed an amended Statement of Defence responding to the amended amended claim on January 31, 2020.

While the final outcome of this action cannot be predicted with certainty, at this time management believes that the ultimate resolution of this action will not have a material impact on our consolidated financial position or results of operations.

OTHER LITIGATION
We and our subsidiaries are subject to various other legal and regulatory actions and proceedings which arise in the normal course of business, including interventions in regulatory proceedings and challenges to regulatory approvals and permits. While the final outcome of such actions and proceedings cannot be predicted with certainty, management believes that the resolution of such actions and proceedings will not have a material impact on our consolidated financial position or results of operations.

TAX MATTERS
We and our subsidiaries maintain tax liabilities related to uncertain tax positions. While fully supportable in our view, these tax positions, if challenged by tax authorities, may not be fully sustained on review.

INSURANCE
We maintain a comprehensive insurance program for us, our operating subsidiaries and certain equity investments. This program includes insurance coverage in types and amounts and is subject to certain deductibles, terms, exclusions and conditions that are generally consistent with coverage considered customary for our industry, however insurance does not cover all events in all circumstances. We self-insure a significant portion of expected losses relating to certain insurance property and casualty risk exposures in the US and Canada through our wholly-owned captive insurance subsidiaries.

In the unlikely event multiple insurable incidents occur which exceed coverage limits within the same insurance period, the total insurance coverage will be allocated among entities on an equitable basis based on an insurance allocation agreement we have entered into with us and other subsidiaries. Insurance estimates include certain assumptions and management judgments regarding the frequency and severity of claims, claim development and settlement practices and the selection of estimated loss among estimates derived using different methods.

32. GUARANTEES

In the normal course of conducting business, we may enter into agreements which indemnify third parties and affiliates. We may also be a party to agreements with subsidiaries, jointly owned entities, unconsolidated entities such as equity method investees, or entities with other ownership arrangements that require us to provide financial and performance guarantees. Financial guarantees include stand-by letters of credit, debt guarantees, surety bonds and indemnifications. To varying degrees, these guarantees involve elements of performance and credit risk, which are not included in our Consolidated Statements of Financial Position. Performance guarantees require us to make payments to a third party if the guaranteed entity does not perform on its contractual obligations, such as debt agreements, purchase or sale agreements, and construction contracts and leases.

We typically enter into these arrangements to facilitate commercial transactions with third parties. Examples include indemnifying counterparties pursuant to sale agreements for assets or businesses in matters such as breaches of representations, warranties or covenants, loss or damages to property, environmental liabilities, and litigation and contingent liabilities. We may indemnify third parties for certain liabilities relating to environmental matters arising from operations prior to the purchase or transfer of certain assets and interests. Similarly, we may indemnify the purchaser of assets for certain tax liabilities incurred while we owned the assets, a misrepresentation related to taxes that result in a loss to the purchaser or other certain tax liabilities related to those assets.

The likelihood of having to perform under these guarantees and indemnifications is largely dependent upon future operations of various subsidiaries, investees and other third parties, or the occurrence of certain future events. We cannot reasonably estimate the total maximum potential amounts that could become payable to third parties and affiliates under such agreements described above; however, historically, we have not made any significant payments under guarantee or indemnification provisions. While these agreements may specify a maximum potential exposure, or a specified duration to the guarantee or indemnification obligation, there are circumstances where the amount and duration are unlimited. As at December 31, 2022, guarantees and indemnifications have not had, and are not reasonably likely to have, a material effect on our financial condition, changes in financial condition, earnings, liquidity, capital expenditures or capital resources.

33. QUARTERLY FINANCIAL DATA (UNAUDITED)

	Q1	Q2	Q3	Q4	Total

ITEM 9. CHANGES IN AND DISAGREEMENTS WITH ACCOUNTANTS ON ACCOUNTING AND FINANCIAL DISCLOSURE

None.

ITEM 9A. CONTROLS AND PROCEDURES

DISCLOSURE CONTROLS AND PROCEDURES
Disclosure controls and procedures are designed to provide reasonable assurance that information required to be disclosed in reports filed with, or submitted to, securities regulatory authorities is recorded, processed, summarized and reported within the time periods specified under Canadian and US securities law. As at December 31, 2022, an evaluation was carried out under the supervision of and with the participation of our management, including the Chief Executive Officer and Chief Financial Officer, of the effectiveness of the design and operations of our disclosure controls and procedures (as defined in Rule 13a-15(e) and 15d-15(e) under the Exchange Act). Based on that evaluation, the Chief Executive Officer and Chief Financial Officer concluded that the design and operation of these disclosure controls and procedures were effective in ensuring that information required to be disclosed by us in reports that we file with or submit to the SEC and the Canadian Securities Administrators is recorded, processed, summarized and reported within the time periods required.

INTERNAL CONTROL OVER FINANCIAL REPORTING
Management's Annual Report on Internal Control over Financial Reporting
Our management is responsible for establishing and maintaining adequate internal control over financial reporting as such term is defined in the rules of the SEC and the Canadian Securities Administrators. Our internal control over financial reporting is a process designed under the supervision and with the participation of executive and financial officers to provide reasonable assurance regarding the reliability of financial reporting and the preparation of our financial statements for external reporting purposes in accordance with US GAAP.

Our internal control over financial reporting includes policies and procedures that:
- pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect transactions and dispositions of our assets;
- provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with US GAAP; and
- provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use or disposition of our assets that could have a material effect on the financial statements.

Our internal control over financial reporting may not prevent or detect all misstatements because of inherent limitations. Additionally, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions or deterioration in the degree of compliance with our policies and procedures.

Our management assessed the effectiveness of our internal control over financial reporting as at December 31, 2022, based on the framework established in *Internal Control – Integrated Framework (2013)* issued by the Committee of Sponsoring Organizations of the Treadway Commission. Based on this assessment, our management concluded that we maintained effective internal control over financial reporting as at December 31, 2022.

The effectiveness of our internal control over financial reporting as at December 31, 2022 has been audited by PricewaterhouseCoopers LLP, Independent Registered Public Accounting Firm appointed by our shareholders. As stated in their *Report of Independent Registered Public Accounting Firm* which appears in *Item 8. Financial Statements and Supplementary Data*, they expressed an unqualified opinion on the effectiveness of our internal control over financial reporting as at December 31, 2022.

Changes in Internal Control Over Financial Reporting
During the three months ended December 31, 2022, there has been no material change in our internal control over financial reporting.

ITEM 9B. OTHER INFORMATION

NORMAL COURSE ISSUER BID
On January 4, 2023, we announced that the TSX had approved our new NCIB to purchase, for cancellation, up to 27,938,163 of the outstanding common shares of Enbridge to an aggregate amount of up to $1.5 billion.

Purchases under the NCIB may be made through the facilities of the TSX, the NYSE and other designated exchanges and alternative trading systems, commencing on January 6, 2023 and continuing until January 5, 2024, when the NCIB expires, or such earlier date on which Enbridge has either acquired the maximum number of common shares allowable under the NCIB or otherwise decided not to make any further repurchases under the NCIB.

A copy of our notice of intention to make a normal course issuer bid may be obtained, free of charge, by contacting Investor Relations by email, phone or mail at:

Email: investor.relations@enbridge.com
Phone Within North America: 1-800-481-2804
Phone Outside North America: 1-403-231-3960
Mail: Enbridge Inc. Investor Relations, 200, 425 – 1st Street S.W., Calgary, Alberta, Canada T2P 3L8

ITEM 9C. DISCLOSURE REGARDING FOREIGN JURISDICTIONS THAT PREVENT INSPECTIONS

Not applicable.

PART III

ITEM 10. DIRECTORS, EXECUTIVE OFFICERS AND CORPORATE GOVERNANCE

Directors of Registrant
The information required by this Item will be disclosed in our Form 10-K/A, which will be filed no later than 120 days after December 31, 2022. This information will also be disclosed in the management proxy information that we prepare in accordance with Canadian corporate and securities law requirements.

Executive Officers of Registrant
The information regarding executive officers is included in Part I. *Item 1. Business - Executive Officers.*

Code of Ethics for Chief Executive Officer and Senior Financial Officers
The information required by this Item will be disclosed in our Form 10-K/A, which will be filed no later than 120 days after December 31, 2022. This information will also be disclosed in the management proxy information that we prepare in accordance with Canadian corporate and securities law requirements.

ITEM 11. EXECUTIVE COMPENSATION

The information required by this Item will be disclosed in our Form 10-K/A, which will be filed no later than 120 days after December 31, 2022. This information will also be disclosed in the management proxy information that we prepare in accordance with Canadian corporate and securities law requirements.

ITEM 12. SECURITY OWNERSHIP OF CERTAIN BENEFICIAL OWNERS AND MANAGEMENT AND RELATED STOCKHOLDER MATTERS

The information required by this Item will be disclosed in our Form 10-K/A, which will be filed no later than 120 days after December 31, 2022. This information will also be disclosed in the management proxy information that we prepare in accordance with Canadian corporate and securities law requirements.

ITEM 13. CERTAIN RELATIONSHIPS AND RELATED TRANSACTIONS, AND DIRECTOR INDEPENDENCE

The information required by this Item will be disclosed in our Form 10-K/A, which will be filed no later than 120 days after December 31, 2022. This information will also be disclosed in the management proxy information that we prepare in accordance with Canadian corporate and securities law requirements.

ITEM 14. PRINCIPAL ACCOUNTING FEES AND SERVICES

The information required by this Item will be disclosed in our Form 10-K/A, which will be filed no later than 120 days after December 31, 2022. This information will also be disclosed in the management proxy information that we prepare in accordance with Canadian corporate and securities law requirements.

PART IV

ITEM 15. EXHIBITS AND FINANCIAL STATEMENT SCHEDULES

(a) Consolidated Financial Statements, Supplemental Financial Data and Supplemental Schedules included in Part II of this annual report are as follows:

Enbridge Inc.:

Report of Independent Registered Public Accounting Firm (PCAOB ID 271)
Consolidated Statements of Earnings
Consolidated Statements of Comprehensive Income
Consolidated Statements of Changes in Equity
Consolidated Statements of Cash Flows
Consolidated Statements of Financial Position
Notes to the Consolidated Financial Statements

All schedules are omitted because they are not required or because the required information is included in the Consolidated Financial Statements or Notes.

(b) Exhibits:

Reference is made to the “Index of Exhibits” following *Item 16. Form 10-K Summary*, which is hereby incorporated into this Item.

ITEM 16. FORM 10-K SUMMARY

Not applicable.

INDEX OF EXHIBITS

Each exhibit identified below is included as a part of this annual report. Exhibits included in this filing are designated by an asterisk ("*"); all exhibits not so designated are incorporated by reference to a prior filing as indicated. Exhibits designated with a "+" constitute a management contract or compensatory plan arrangement.

Exhibit No.		Name of Exhibit
3.1		Articles of Continuance of the Corporation, dated December 15, 1987 (incorporated by reference to Exhibit 2.1(a) to Enbridge's Registration Statement on Form S-8 filed May 7, 2001)
3.2		Certificate of Amendment, dated August 2, 1989, to the Articles of the Corporation (incorporated by reference to Exhibit 2.1(b) to Enbridge's Registration Statement on Form S-8 filed May 7, 2001)
3.3		Articles of Amendment of the Corporation, dated April 30, 1992 (incorporated by reference to Exhibit 2.1(c) to Enbridge's Registration Statement on Form S-8 filed May 7, 2001)
3.4		Articles of Amendment of the Corporation, dated July 2, 1992 (incorporated by reference to Exhibit 2.1(d) to Enbridge's Registration Statement on Form S-8 filed May 7, 2001)
3.5		Articles of Amendment of the Corporation, dated August 6, 1992 (incorporated by reference to Exhibit 2.1(e) to Enbridge's Registration Statement on Form S-8 filed May 7, 2001)
3.6		Articles of Arrangement of the Corporation dated December 18, 1992, attaching the Arrangement Agreement, dated December 15, 1992 (incorporated by reference to Exhibit 2.1(f) to Enbridge's Registration Statement on Form S-8 filed May 7, 2001)
3.7		Certificate of Amendment of the Corporation (notarial certified copy), dated December 18, 1992 (incorporated by reference to Exhibit 2.1(g) to Enbridge's Registration Statement on Form S-8 filed May 7, 2001)
3.8		Articles of Amendment of the Corporation, dated May 5, 1994 (incorporated by reference to Exhibit 2.1(h) to Enbridge's Registration Statement on Form S-8 filed May 7, 2001)
3.9		Certificate of Amendment, dated October 7, 1998 (incorporated by reference to Exhibit 2.1(i) to Enbridge's Registration Statement on Form S-8 filed May 7, 2001)
3.10		Certificate of Amendment, dated November 24, 1998 (incorporated by reference to Exhibit 2.1(j) to Enbridge's Registration Statement on Form S-8 filed May 7, 2001)
3.11		Certificate of Amendment, dated April 29, 1999 (incorporated by reference to Exhibit 2.1(k) to Enbridge's Registration Statement on Form S-8 filed May 7, 2001)
3.12		Certificate of Amendment, dated May 5, 2005 (incorporated by reference to Exhibit 2.1(l) to Enbridge's Registration Statement on Form S-8 filed August 5, 2005)
3.13		Certificate of Amendment, dated May 11, 2011 (incorporated by reference to Exhibit 3.13 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.14		Certificate of Amendment, dated September 28, 2011 (incorporated by reference to Exhibit 3.14 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.15		Certificate of Amendment, dated November 21, 2011 (incorporated by reference to Exhibit 3.15 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)

3.16		Certificate of Amendment, dated January 16, 2012 (incorporated by reference to Exhibit 3.16 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.17		Certificate of Amendment, dated March 27, 2012 (incorporated by reference to Exhibit 3.17 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.18		Certificate of Amendment, dated April 16, 2012 (incorporated by reference to Exhibit 3.18 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.19		Certificate of Amendment, dated May 17, 2012 (incorporated by reference to Exhibit 3.19 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.20		Certificate of Amendment, dated July 12, 2012 (incorporated by reference to Exhibit 3.20 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.21		Certificate of Amendment, dated September 11, 2012 (incorporated by reference to Exhibit 3.21 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.22		Certificate of Amendment, dated December 3, 2012 (incorporated by reference to Exhibit 3.22 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.23		Certificate of Amendment, dated March 25, 2013 (incorporated by reference to Exhibit 3.23 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.24		Certificate of Amendment, dated June 4, 2013 (incorporated by reference to Exhibit 3.24 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.25		Certificate of Amendment, dated September 25, 2013 (incorporated by reference to Exhibit 3.25 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.26		Certificate of Amendment, dated December 10, 2013 (incorporated by reference to Exhibit 3.26 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.27		Certificate of Amendment, dated March 10, 2014 (incorporated by reference to Exhibit 3.27 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.28		Certificate of Amendment, dated May 20, 2014 (incorporated by reference to Exhibit 3.28 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.29		Certificate of Amendment, dated July 15, 2014 (incorporated by reference to Exhibit 3.29 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.30		Certificate of Amendment, dated September 19, 2014 (incorporated by reference to Exhibit 3.30 to Enbridge's Registration Statement on Form F-4 filed September 23, 2017)
3.31		Certificate of Amendment, dated November 22, 2016 (incorporated by reference to Enbridge's Report of Foreign Issuer on Form 6-K filed December 1, 2016)
3.32		Certificate of Amendment, dated December 15, 2016 (incorporated by reference to Enbridge's Report of Foreign Issuer on Form 6-K filed December 16, 2016)
3.33		Certificate of Amendment, dated July 13, 2017 (incorporated by reference to Enbridge's Report of Foreign Issuer on Form 6-K filed July 13, 2017)
3.34		Certificate of Amendment, dated September 25, 2017 (incorporated by reference to Exhibit 3.34 to Enbridge's Annual Report on Form 10-K filed February 16, 2018)
3.35		Certificate of Amendment, dated December 7, 2017 (incorporated by reference to Exhibit 3.35 to Enbridge's Annual Report on Form 10-K filed February 16, 2018)
3.36		Certificate of Amendment, dated February 27, 2018 (incorporated by reference to Exhibit 3.1 to Enbridge's Current Report on Form 8-K filed March 1, 2018)

3.37		Certificate of Amendment, dated April 9, 2018 (incorporated by reference to Exhibit 3.1 to Enbridge's Current Report on Form 8-K filed April 12, 2018)
3.38		Certificate of Amendment, dated April 10, 2018 (incorporated by reference to Exhibit 3.1 to Enbridge's Current Report on Form 8-K filed April 12, 2018)
3.39		Certificate and Articles of Amendment, dated July 6, 2020 (incorporated by reference to Exhibit 3.1 to Enbridge's Current Report on Form 8-K filed July 8, 2020)
3.40		Certificate of Amendment, dated January 17, 2022 (incorporated by reference to Exhibit 3.1 to Enbridge's Current Report on Form 8-K filed January 20, 2022)
3.41		Certificate of Amendment, dated January September 15, 2022 (incorporated by reference to Exhibit 3.1 to Enbridge's Current Report on Form 8-K filed September 20, 2022)
3.42		Certificate of Amendment, dated January September 15, 2022 (incorporated by reference to Exhibit 3.2 to Enbridge's Current Report on Form 8-K filed September 20, 2022)
3.43		General By-Law No. 1 of Enbridge Inc. (incorporated by reference to Exhibit 3.40 to Enbridge's Form 10-K filed February 11, 2022)
3.44		By-Law No. 2 of Enbridge Inc. (incorporated by reference to Enbridge's Current Report on Form 6-K filed December 5, 2014)
4.1		Form of Indenture between Enbridge Inc. and Deutsche Bank Trust Company Americas to be dated February 25, 2005 (incorporated by reference to Exhibit 7.1 to Enbridge's Registration Statement on Form F-10 filed February 4, 2005)
4.2		First Supplemental Indenture between Enbridge Inc. and Deutsche Bank Trust Company Americas, dated March 1, 2012 (incorporated by reference to Exhibit 7.3 to Enbridge's Registration Statement on Form F-10 filed May 11, 2012)

Exhibit 10.42

FOURTH AMENDMENT TO THE
ENBRIDGE SUPPLEMENTAL PENSION PLAN FOR UNITED STATES EMPLOYEES
(As Amended and Restated Effective January 1, 2005)

Pursuant to Section 8.1 of the Enbridge Employee Services, Inc. Employees' Supplemental Plan, as amended (the "Supplemental Plan"), and the authority delegated to it by the Board of Directors of Enbridge Employee Services, Inc. (the "EESI Board"), the Human Resources & Compensation Committee of the Enbridge Inc. Board of Directors (the "HRCC") has approved, confirmed, and adopted this Fourth Amendment at a meeting of the HRCC held on the 31st day of July 2018, at which a quorum was present.

1. Effective as of January 1, 2019, Section l.l(ee) of the Supplemental Plan is hereby deleted and replaced, in its entirety, with the following new Section 1.1(ee):

(ee) **"Senior Management Employee"** means an employee of a Participating Company who is employed in a position of Director or above which exceeds the minimum job classification rating for the Company as prescribed by the President and Chief Executive Officer of Enbridge Inc. In order to be a "Senior Management Employee," an employee must be a "member of a select group of management or highly compensated employees" within the meaning such phrase under Sections 201(2), 301(a)(3), and 40l(a)(l) of ERISA.

2. Effective as of January 1, 2019, Section 1.1 of the Supplemental Plan is hereby amended to add the following new Section 1.1(nn) at the end thereof

(nn) **"Participating Company"** means the Company; Spectra Energy Corp; Spectra Energy Operating Company, LLC; and PanEnergy Services, Limited Partnership.

As amended hereby, the Supplemental Plan is hereby specifically ratified and reaffirmed in its entirety.

To record this Fourth Amendment, the undersigned delegate of the HRCC, pursuant to authorization of the HRCC, hereby confirms and executes the Fourth Amendment on this 20th day of December 2018.

Marc Weil, VP and Chief HR Officer
on behalf of the
Human Resources & Compensation Committee
of the Enbridge Inc. Board of Directors

Exhibit 10.43

FIFTH AMENDMENT TO THE ENBRIDGE SUPPLEMENTAL PENSION PLAN FOR UNITED STATES EMPLOYEES (AS AMENDED AND RESTATED EFFECTIVE JANUARY 1, 2005)

Pursuant to the authority delegated to them by resolutions of the Board of Directors (the "Resolutions") of Enbridge Inc. ("EI") authorizing the transaction described in the Securities Purchase Agreement between Enbridge Gas Distribution Inc. and Liberty Utilities Co. (the "SPA"), the undersigned Chief Human Resources Officer of EI and the Vice President of People Operations, Human Resources of PanEnergy Services, LP hereby adopt this Fifth Amendment to the Enbridge Supplemental Pension Plan for United States Employees (the "Plan"), to be effective as of the SLG Closing (the "Effective Date");

WHEREAS, the Resolutions authorize any two officers of the Corporation or an Affiliate thereof, to take any action that they deem to be necessary or desirable to effectuate the transaction described in the SPA; and

WHEREAS, Section 6.l0(e) of the SPA requires that (i) Saint Lawrence Gas Company, Inc. ("SLG") and any other applicable subsidiary affiliate of SLG cease to be participating employers in the Plan, (ii) the employees and former employees of SLG and its subsidiary affiliates who, immediately prior to the closing of the transaction contemplated in the SPA, have an accrued benefit under the Plan (the "SLG Participants") shall cease participation in the Plan, and (iii) all of the liabilities of the SLG Participants under the Plan shall be assumed by the Buyer or the Affiliate of Buyer, as defined in the SPA.

NOW, THEREFORE, the Plan is hereby amended, effective as of the Effective Date, as follows:

1. ***Plan Section 1.1(t) (definition of "Participating Affiliate") is hereby amended and replaced, in its entirety, as follows:***

(t) **"Participating Affiliate"** means (i) the Company, (ii) Spectra Energy Corp, (iii) Spectra Energy Operating Company LLC, and (iv) PanEnergy Service, Limited Partnership. As of the SLG Closing, St. Lawrence Gas Company, Inc. has ceased to be a Participating Affiliate.

2. ***Plan Section 1.1 is hereby amended to add the following new definitions at the end thereof:***

(oo) **"SLG Buyer Supplemental Plan"** has the definition given to the term "Buyer Supplemental Plan" in the SLG SPA.

(pp) **"SLG Closing"** has the definition given to the term "Closing" in the SLG SPA.

(qq) **"SLG SPA"** means the Securities Purchase Agreement between Enbridge Gas Distribution Inc. and Liberty Utilities Co. dated August 31, 2017, and as it may be amended.

3. ***Addendum D to the Plan is hereby amended to add the following paragraphs at the end thereof:***

Effective as of the SLG Closing, St. Lawrence Gas Company, Inc. shall cease to be an Affiliate. In addition, pursuant to the SLG SPA, effective as of the SLG Closing:

(1) St. Lawrence Gas Company, Inc. shall cease to be a Participating Affiliate; and

(2) St. Lawrence Gas Participants shall cease to be Plan Participants and thus shall not be entitled to receive any benefit payable under the Plan; and

(3) The liabilities of this Plan relating to the St. Lawrence Gas Participants shall be transferred to the SLG Buyer Supplemental Plan on or after the date of the SLG Closing and all of their benefits shall be fully provided under the SLG Buyer Supplemental Plan and not this Plan.

The SLG SPA provides that, effective as of the SLG Closing, St. Lawrence Gas Participants shall participate in the SLG Buyer Supplemental Plan which shall provide each St. Lawrence Gas Participant with accrued benefits that are no less than the accrued benefits with respect to each such person under the Plan as of the SLG Closing. Any benefits to be provided under the SLG Buyer Supplemental Plan will be governed by the terms and conditions of the SLG Buyer Supplemental Plan and not by this Plan to any extent.

As amended hereby, the Supplemental Plan is *hereby specifically ratified and reaffirmed in its entirety.*

To record this Fifth Amendment, the undersigned officers, pursuant to authorization of the Board of Directors of El, hereby confirm and execute the Fifth Amendment on this 28th day of October 2019.

CERTIFICATION PURSUANT TO SECTION 302 OF THE SARBANES-OXLEY ACT OF 2002

I, Gregory L. Ebel, certify that:

1. I have reviewed this annual report on Form 10-K of Enbridge Inc.;

2. Based on my knowledge, this report does not contain any untrue statement of a material fact or omit to state a material fact necessary to make the statements made, in light of the circumstances under which such statements were made, not misleading with respect to the period covered by this report;

3. Based on my knowledge, the financial statements, and other financial information included in this report, fairly present in all material respects the financial condition, results of operations and cash flows of the registrant as of, and for, the periods presented in this report;

4. The registrant's other certifying officer and I are responsible for establishing and maintaining disclosure controls and procedures (as defined in Exchange Act Rules 13a-15(e) and 15d-15(e)) and internal control over financial reporting (as defined in Exchange Act Rules 13a-15(f) and 15d-15(f)) for the registrant and have:

    a. Designed such disclosure controls and procedures, or caused such disclosure controls and procedures to be designed under our supervision, to ensure that material information relating to the registrant, including its consolidated subsidiaries, is made known to us by others within those entities, particularly during the period in which this report is being prepared;

    b. Designed such internal control over financial reporting, or caused such internal control over financial reporting to be designed under our supervision, to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles;

    c. Evaluated the effectiveness of the registrant's disclosure controls and procedures and presented in this report our conclusions about the effectiveness of the disclosure controls and procedures, as of the end of the period covered by this report based on such evaluation; and

    d. Disclosed in this report any change in the registrant's internal control over financial reporting that occurred during the registrant's most recent fiscal quarter (the registrant's fourth fiscal quarter in the case of an annual report) that has materially affected, or is reasonably likely to materially affect, the registrant's internal control over financial reporting; and

5. The registrant's other certifying officer and I have disclosed, based on our most recent evaluation of internal control over financial reporting, to the registrant's auditors and the audit committee of the registrant's board of directors (or persons performing the equivalent functions):

    a. All significant deficiencies and material weaknesses in the design or operation of internal control over financial reporting which are reasonably likely to adversely affect the registrant's ability to record, process, summarize and report financial information; and

    b. Any fraud, whether or not material, that involves management or other employees who have a significant role in the registrant's internal control over financial reporting

Answer to Interrogatory from
London Property Management Association (LPMA)

Interrogatory

Reference:

Exhibit 1, Tab 8

Question(s):

a) Please update the evidence in Tab 8 to include the audited consolidated financial statements for 2022 (similar to Attachment 2) when they are available, including a reconciliation of audited EGI income (per financial statements) to corporate income for utility income determination purposes EGI utility income actual results (similar to Attachments 6 & 7), and the Annua Report and Management Discussion and Analysis (MD&A) for the most recent year from the Parent Company (similar to Attachment 10).

b) Please provide any rating agency reports that are more recent than those noted in the evidence.

c) Please provide the most recent Short Form Base Shelf Prospectus, if more recent than September 8, 2021.

d) Please provide the 2022 federal and provincial tax returns (similar to Attachment 14) when they become available.

Response:

a) Please see response at Exhibit I.1.8-STAFF-14 part b) ii) for the 2022 Enbridge Gas Inc. Audited Consolidated Financial Statements and Exhibit I.1.8-CME-7 part a) for the 2022 Enbridge Inc. Annual Report. The reconciliations of audited Enbridge Gas income (per financial statements) to corporate income for utility income determination purposes Enbridge Gas utility income actual results are provided at Attachment 1 and Attachment 2.

b) Please see response at Exhibit I.1.8-STAFF-14 part b) iv).

c) The Short Form Base Shelf Prospectus, dated September 8, 2021, provided at Exhibit 1, Tab 8, Schedule 1, Attachment 13 is the most recent available.

d) The 2022 federal and provincial tax returns will be available in June 2023.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

1-8-1

Question(s):

Please provide in a single table, for each year between 2013 and 2022, the annual ESM calculations for Enbridge (or EGD and Union as would have been the case before the amalgamation) in the same format as is provided in Enbridge's annual ESM/DVA disposition application.

Response:

Please see Attachment 1 for tables showing the annual ESM calculations for Enbridge Gas from 2019 to 2022 as well as separate tables for both EGD and Union for the years 2013 to 2018.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

1-8-1, Attachment 4

Question(s):

For each year between 2013 and 2018, and for 2022, please provide a similar table of annual actual utility income, for Enbridge's (or EGD and Union as would have been the case before the amalgamation).

Response:

Please see Attachment 1 for tables showing annual actual utility income for both EGD and Union for the years 2013 through 2018 as well as Enbridge Gas preliminary actuals for 2022.

Notes on Adjustments:

(1)	Reclassification of Union rate zone optimization revenue as a cost of gas reduction	(16.6)
	Elimination of the UGL rate zone unregulated storage cost from EGD rate zone revenues	(17.4)
		(34.0)
(2)	Elimination of the Union rate zone shareholder portion of net optimization activity (before tax)	(0.9)
(3)	Elimination of the Union rate zone shareholder portion of net short-term storage revenue (before tax)	(0.1)
(4)	Adjust EGD rate zone OBA costs to reflect EB-2013-0099 approved unit costs agreed to be used for determining net re	(4.8)
	Elimination of EGD rate zone Open Bill shareholder incentive	0.3
	Elimination of EGD rate zone shareholder portion of transactional service revenues	(4.8)
	Elimination of demand-side management incentive	(5.8)
	Elimination of EGD rate zone net revenue from ABC T-service, considered to be non-utility	(0.7)
		(15.9)
(5)	Elimination of Part VI.1 Tax from other income	(11.5)
	Elimination of interest income from investments not included in utility rate base	(0.1)
	Elimination of interest income from affiliates	(3.4)
		(15.1)
(6)	Elimination of donations	(1.1)
	Elimination of OEB penalty assessed in EB-2021-0204 (Assurance of Voluntary Compliance and Administrative Penalty	(0.3)
	Elimination of CFCAM charges	(8.4)
	Adjust unregulated storage back to legacy methodology instead of harmonized	6.0
		(3.9)
(7)	Eliminate amortization of PPD (purchase price discrepancy)	(22.5)
(8)	Interest on security deposits held during the year and included in elimination of corporate interest exp. Expense incurred to reduce bad debt. The average amount of the security deposit held during the year is applied as a reduction to the allowance for working capital in rate base	1.1

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

1-8-2, p.5

Question(s):

Enbridge has provided a table that shows accounting standard updates that “had no impact or an immaterial impact”. For the purpose of this table, what does Enbridge consider a “immaterial impact”.

Response:

Enbridge Gas considered any accounting standard update that impacted revenue requirement by less than $1 million to be immaterial.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory
Reference:

Exhibit 1, Tab 9, Schedule 1, p. 20

Question(s):

Over the deferred rebasing term (2019 to 2023), Enbridge Gas expects to incur approximately $252.2 million in capital expenditures related to integration efforts. Enbridge Gas has noted that the revenue requirement to support these investments was not included in base rates, and as such was borne by the shareholder.

a) Please confirm that investments (revenue requirement borne by the shareholder) on all capital expenditures (with the exception of recoveries related to approved Incremental Capital Module funding) and not just capital expenditures related to integration efforts are not included in base rates during the deferred rebasing term.

b) Please confirm that Enbridge Gas has requested that the net book value of integration-related capital spending incurred during the deferred rebasing term be added to the 2024 rate base.

Response:

a) Enbridge Gas agrees that during the deferred rebasing term none of its capital investments/additions (inclusive of integration investments), with the exception of approved projects which received ICM funding, were explicitly reflected in base rates. However, during the deferred rebasing term, the ICM threshold was used to determine the level of capital investments that were presumed to be recovered in base rates, before incremental funding through the ICM mechanism could be requested. Over the deferred rebasing term, capital projects related to integration were not included in the determination of annual ICM eligible amounts, as Enbridge Gas was expected to fund the revenue requirement for such projects through amalgamation synergies and savings. Specifically, integration related capital investments were excluded from the annual total in-service capital forecasts, which were then compared to the annual ICM threshold values to determine the maximum ICM eligible capital amount as part of the Company’s annual rate proceedings. As such, integration related capital projects were expressly assumed not to be recovered through base rates.

b) Confirmed. Enbridge Gas has proposed that the net book value of the integration-related capital be added to 2024 rate base to match the regulatory treatment of the annual synergies generated, which are included in the revenue requirement and are being used to fund the capital invested.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 1/T9/S1/pp. 3-4

Question(s):

"Enbridge Gas undertook significant investments during the rebasing term, in both OM&A and Capital, to deliver the anticipated savings. Enbridge Gas defined integration costs as one-time incremental costs required to deliver value for an opportunity or set of opportunities related to utility integration, and included items such as labour, consulting and capital expenditures. Integration costs, both OM&A and capital expenditures, were identifies and managed separately throughout the deferred rebasing term. These investments were made to deliver the highest level of sustainable savings to customers, even as investments in the latter years of the term provide limited opportunity for Enbridge Gas to benefit from these investments as the sustained savings would be rebased at the end of the rebasing term. At the time these savings are rebased to customers, so are the corresponding net book value of integration capital costs."

"Integration results were delivered through a portfolio of initiatives governed by senior leadership and enabled through a program office."

a) Please set out a list of all of the one-time incremental integration costs incurred during the 5-year rebasing period, both OM&A and capital;

b) Please list the portfolio of specific initiatives that were enabled through the program office;

c) Please specifically identify the quantitative and qualitative benefits and costs for each specific initiative;

d) Please provide a complete list of all cost savings embedded in the 2024 Revenue Requirement related to the merger;

e) Please describe the process undertaken internally to define merger costs and savings;

f) Please indicate whether EGI retained external consultants to assess these costs and savings. If so, please provide any reports prepared by these consultants.

Response:

a) Please see Exhibit 1, Tab 9, Schedule 1, pages 17 to 19 for a listing and explanation of O&M expenditures and Exhibit 1, Tab 9, Schedule 1, Attachment 1 for a listing and explanation of Capital Expenditures.

b) The Program Office enabled priority initiatives that crossed multiple areas. Attachment 1 lists these initiatives, their descriptions, and their supporting qualitative benefits. These initiatives aligned policies, programs, processes, and procedures for customers and for internal teams, created alignment for delivering services to stakeholders through common operating models, and generated an aligned asset management program. While many initiatives also delivered quantitative savings (please see response at part c), the qualitative benefits for the integration portfolio were delivered to support safe, reliable and effective operations, while effectively managing risk.

c) The integration portfolio delivered the qualitative benefits as listed in Attachment 1. The quantitative savings for each initiative were reviewed individually, and the following methodologies were used to calculate the savings: For organizational restructuring, roles were identified for elimination and removed, and all FTE costs were removed from the corresponding budget; for non-labour initiatives, Enbridge Gas departments quantified the savings, and the sustainable amounts were removed from the corresponding budgets. Further information on the initiatives by type with supporting quantitative benefits and costs are in Table 1:

Table 1
Integration Initiative Quantitative Benefits

Initiative Type	Department	Sustained Savings in 2024 Rates	Total Benefit Over Term	Total CapEx Over Term
			$millions	
Integration Portfolio Roles				2
Alignment of Policies, Programs, Processes and Procedures	Business Development and Regulatory	1.7	7	
	Energy Services		-	23
	Engineering	1.7	6	0
	Operations	2.3	9	65
Cost Rationalization	Business Development and Regulatory	2.1	11	
	Engineering		0	
	Engineering & STO	0.3	1	
	Operations	1.4	6	
	Shared Services: REWS	1.0	4	67
Customer Care Integration	Business Development and Regulatory	0.1	1	3
	Customer Care	16.6	40	72
	Energy Services		-	
	Operations		-	16
Integration & Execution of Operating Models	Operations	3.7	12	3
Organizational Restructuring (Labour)		54.9	231	
Total		86.0	328	252

d) Integration savings (in millions) in the 2024 Test Year Forecast is as follows:

Table 2

Line No.	Type	2019	2020	2021	2022	2023	2024	
		(a)	(b)	(c)	(d)	(e)	(f)	
1	Alignment of Policies, Programs, Processes & Procedures	1.7	3.4	5.5	5.6	5.7	5.7	
2	Cost Rationalization	2.6	4.2	4.9	4.9	4.9	4.9	
3	Customer Care Integration	2.8	2.9	1.8	16.8	16.8	16.8	
4	Integration & Execution of Operating Models		0.1	4.3	3.7	3.7	3.7	
5	Organizational Restructuring (Labour)	25.1	41.8	54.8	54.8	54.9	54.9	
6								86.0

e) Costs were deemed integration related if they were one-time incremental costs required to deliver value and were deemed necessary to bring together Union Gas and EGD to a single efficient structure. Savings were deemed integration related if the benefits were sustainable and resulted from the integration of the two legacy utilities during the 5-year deferred rebasing term. Both costs and savings would not have occurred without the merger.

f) No. Enbridge Gas did not retain external consultants to assess these costs and savings.

Initiatives Enabled by Program Office

Department	Initiative	Description / Qualitative Benefits
Business Development and Regulatory	2024 Rebasing	This project developed EGI plans for filing the 2024 Rebasing application.
	Align the Enbridge Brand	This project successfully completed the rebranding of various asset groups, including signage, vehicles, apparel, external applications, customer communications, social media, and EGI websites.
	In-franchise Service Harmonization	This project conducted a high-level review of existing legacy in-franchise and ex-franchise services to develop proposals for harmonized services in support of the Rebasing application.
	Integrated Resource Planning	This project develops harmonized processes and procedures and integrates with the AMP processes to ensure growth reinforcement infrastructure applications review and consider alternative options to new infrastructure build submissions, further supporting DSM, Energy Transition and stakeholder expectations.
	Rates and Service Harmonization Proposal	This project developed detailed proposals for the harmonized services and rates to support the 2024 rebasing application, including rate class and rate zone proposals. EGI consulted with customers and customer associations to help with the shaping of the harmonized proposals.
	Web Integration	This project consolidated information into the new harmonized enbridgegas.com website from two primary websites and six microsites to better reflect the needs of the integrated utility. The navigation architecture provides a harmonized web service presence for all our business units, supports our revenue-generating product and service offerings, and supports the move to increased self-serve options. Along with meeting the requirements contained in The Accessibility for Ontarians with Disabilities Act (AODA), the new website is also fully brand compliant, for a more positive customer experience.
Corporate	Connect	This project was an enterprise driven initiative that provided our field technicians and supporting staff with an enterprise grade, consolidated solution for executing EGI work in the field.
	Enterprise Asset Management Alignment	This project implemented a harmonized, enterprise-wide framework to optimize realized value from our assets through defendable and repeatable decisions that balance costs, opportunities and risks against the desired performance over the lifecycle of our assets.
	Learning Fusion/Workday Learning	This project designed and implemented one learning and development strategy, consolidated and upgraded training course content and a single Learning Management System across the EGI and the enterprise.
Customer Care	Contract Market Harmonization	This project will integrate the key systems and processes for contract markets, including Large Volume (LV), Direct Purchase (DP), Storage and Transmission (S&T), and Gas Supply, and facilitate in-franchise and ex-franchise service harmonization to deliver an outstanding customer experience.
	Customer Information System (CIS) Integration	This project integrated EGI to a common Customer Information System (CIS) resulting in the retirement of the Union Gas Banner CIS, which also required an upgrade and migration to one SAP platform to ensure ongoing reliable operations.
	Large Volume Customer Operating Rule and Process Harmonization	This project developed and implemented harmonized rules that govern how contract parameters are established in the contract rate market, how compliance/authorization of overrun is managed, and developed consistent customer communication templates. These changes have created a more consistent customer experience across all rate zones, support growth of the system, reduced the level of effort to manage contract renewals, and increased the level of transparency for our customers.
Energy Services	Cost of Gas Automation	This project integrated EGD processes into the existing automated utility gas purchase and financial reporting system in SAP for Energy Services and Finance, delivering a consolidated system and processes across EGI. The integrated system provides functionality for gas inventory and financial revenue reporting related to cost of gas processes, including contracting, purchasing, invoicing, and nominations.
	Ex-franchise Service & Rate Harmonization	This project reviewed and recommended the underpinning service and rate design proposal for the ex-franchise contracted services of the integrated utility to support the Rebasing application.
	In-franchise Service Management	This project defined the accountabilities and processes for creating, facilitating, and maintaining new and existing services for In-franchise customers.
	Large Volume Measurement Systems Integration	This project is aligning the large volume measurement systems across GDS, leading to consistent volume measurement data validation for all contract large volume customers.
	Gas Control Centre Consolidation and SCADA Migration	This project consolidated the Edmonton and Chatham Gas Control Centres in Chatham, and migrated the EGD SCADA (Supervisory Control and Data Acquisition) system to the Cygnet SCADA system resulting in a single Gas Control Centre and SCADA solution for EGI that continues to deliver safe, reliable, and efficient operations.
	Utility Weather & Demand Harmonization	This project successfully developed harmonized Weather and Demand planning processes to provide customers a reliable service with the Gas Supply Plan, storage, transmission, and distribution systems, at a reasonable cost. This work is included in the harmonization proposal for rebasing, identifying harmonized Heating Degree Day and Design Day demand methodologies.
Engineering	Community Expansion Process Integration	This project integrated and standardized processes and procedures to support the community expansion program. These new processes and procedures cover all six stages of the project lifecycle and have been integrated with the new EGI organizational structure and systems that support our efforts to grow the business.
	Consolidated Asset Management Plans	This project developed the first consolidated Asset Management Plan (AMP) for EGI that was filed with the OEB on October 15, 2020. This AMP supported the 2021 budget and provided the basis for the long-range plan. Through this effort a consistent value-based decision-making framework was developed to standardize our approach to optimizing the investment portfolio based on cost, risk, and performance. The project required the establishment of a common AMP approach, processes, and procedures, including the corresponding tools that are used to support decision making (i.e., Copperleaf C55).
	Content Management Program	This project is managing the integration and implementation of policies, processes, procedures and design specifications, including technical content and Operating Standards across Operations and Engineering to mitigate EGI risks and to ensure code compliance.
	Cross Bore Risk Mitigation	This project investigated and assessed the current risk associated with trenchless installations using historical construction information and industry leading practices. Updated construction practices and procedures, including probability and risk management tools, were developed to address both historical installations, as well as to reduce the potential creation of any new cross bores. Common practices have been employed across EGI.
	EGI Copperleaf C55 Implementation	This project introduced a new asset management application Copperleaf (C55) that went live at EGI to hundreds of users in January 2020; and this tool and its associated processes are helping make investment decisions more consistently, transparently, and aligned with the organization's strategic goals. The successful implementation and launch also served to align EGI with the Enterprise Asset Management approach and systems.
	Integrity Management Program Evolution	This project is being completed in phases over multiple years and included the harmonization of the Integrity Management Program, practices and systems for EGI, followed by the alignment to the Enterprise Standard, as well as addressing assurance observations and making improvements by implementing industry leading practices.
	Management of Change Program Implementation	This project delivered a new integrated Management of Change (MOC) standard and process, with a focus on departmental triggers for making changes and how to manage them safely. MOC is a critical element of the Integrated Management System, and this was a pivotal effort to enhance operational safety and reliability.
	Records Management Strategy	This project conducted current and future state analysis developing an end-to-end view of how records are created and used, and how to address challenges and opportunities for improvement of records management across the gas carry asset lifecycle. The outcome of this strategy work was a vision, including scope, a high-level roadmap to support the future design and implementation of integrated records management processes, resources, and systems for Operations and Engineering.
	Integrated Management Systems	This project harmonized the Integrated Management System (IMS) governance and framework. In addition, it identified and implemented process efficiencies, integrated the elements of the IMS, and governed the integration of the eight IMS management programs to meet applicable IMS and management program requirements to support safe and reliable operations. Management Programs included: Asset, Emergency, Environmental, Health & Safety, Integrity, Security, Damage Prevention and Control Room.

Operations	Operating Standards Integration and Implementation	This project supported through the Content Management Program, developed and implemented a number of priority Operating Standards for EGI, including but not limited to Easement and Pipeline Markers, Corrosion Survey, Leak Repair and Leak Survey, Measurement and Regulators Station Inspections, Pressure Regulation and Protection, and Valve Inspection and Repair.
	Customer Attachment Harmonization	This project is aligning our customer attachment policies, systems and processes to support our growth strategies and to enhance our customers experience. This project is being implemented in phases in conjunction with the EGI Sync program.
	Damage Reduction Strategy Program	This project represents the implementation of a collection of strategic harmonized multi-year initiatives aimed at reducing third-party damages to EGI assets. Initiatives are centered on awareness, education, and partnerships, and 3rd party Advertising/Marketing firms are helping to ensure effective communications and engagement with contractors and homeowners. Additionally, technology and predictive analytics will be employed to enable a more proactive approach to distribution protection measures and practices.
	Distribution Operations Workflow Integration	This project reviewed EGD and Union Distribution Operations workflow processes, identified differences, and made recommendations for harmonized processes, as well as identified gaps for resolution. These outcomes were used to define the integrated operations future state processes and system requirements to support other initiatives such as the Asset & Work Management System (Maximo) integration.
	EGI Sync Program	EGI Sync is a program that is driving EGI transformation and integration through ground up business unit readiness, alignment, prioritization, sequencing and implementation of the EGI Asset and Work Management System (AWS), Enterprise Mobility (Connect), and Customer Information Systems (CIS) solutions.
	Integrated Utility Asset & Work Management System (AWS Phase 1)	This project delivered the foundational integrated Utility Asset & Work Management System (Maximo) for Utilization and Maintenance work to support effective utility planning, decision making and work execution, focusing on policies, processes and procedures, and aligning where operationally feasible.
	Integrated Utility Asset & Work Management (AWS Phase 2 & 3)	This project is building upon the foundational Utility Asset & Work Management System (AWS) project to integrate additional work management related systems and processes within Maximo by aligning Construction, Customer Attachment and Meter Shop systems and processes for Maximo, Get Connected, and Customer Connections Work Suite systems. This work also included the integration with External Alliance Partner systems and processes for our business teams, impacting over 2,600 end users. AWS Phase 3 is enhancing work management efficiencies through the migration of Union Distribution Station Operations and Telemetry assets to Maximo, Click Schedule and Mobile, including the alignment of supporting systems, processes, procedures, and performance measures and reporting.
	Work and Resource Strategy Implementation	This project enabled the successful implementation of our Work and Resource Strategy to align the operating model for Distribution Operations to our environments of remote, rural, urban, and metro. It also ensured the identified insourced and outsourced work and resource plans were implemented across all regions and levels. This initiative also ensured both external service providers and internal resources are available, engaged, trained, and have the tools, processes, and procedures to complete work.
	Work Management Integration	This project is implementing the work management strategy delivering an optimized combination of organization, processes, and systems for Distribution Operation's front and back-end functions that support work planning, scheduling, execution, closure and analysis. This project delivers the consolidation of Work Management Centres.
	Emergency Response Structure and Procedures Manual	This project aligned the Emergency Operations Centre (EOC) and Incident Command protocols for the utility, and produced an integrated Emergency Procedures Manual for EGI which was filed with the Canadian Energy Regulator prior to the regulatory deadline of April 1, 2020. This effort defined consistent emergency response procedures, training, an integrated on-call schedule for all EGI Incident Command System groups, and developed a consistent notification and EOC trigger criteria and process.
	Fleet Maintenance & Garage Strategy	This project successfully aligned all EGI Fleet assets with the enterprise fleet management preventative maintenance platform (Element), consolidated and optimized fleet maintenance operations, and created an amalgamated central fleet management support team, providing clear and consistent accountability, standards, processes, and support.
	Warehouse and Material Management and Logistics	This project consolidated the material warehouses from four facilities (located at Niagara, Markham, London and Sudbury) to two (located in Markham and London), streamlining material management and logistics across EGI.
Shared Services: Safety & Reliability	Safety Program Integration	This project is harmonizing all the safety programs for EGI to ensure a consistent standard of safety is available for all employees at EGI.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 1/T9/S1/p. 5/ Tables 2 and 3

Question(s):

Tables 2 and 3 set out Integration Savings as Achieved by Category and Integration Savings as Achieved by Area.

a) For each of the 2023 amounts in these two Tables please provide a detailed explanation as to how they were calculated. Please include all assumptions;

b) Please recast the Tables 2 and 3 to include the amounts of savings embedded in the 2024 Revenue Requirement. Please provide a detailed explanation as to how these amounts were calculated.

c) Please provide a forecast of any further integration savings for the years 2025-2028

Response:

a) Please see response at Exhibit I.1.9-CCC-25 part c) for explanation of how savings were calculated.

b) The savings that are listed under the 2023 Bridge Year are the full integration synergy savings forecast to be achieved through to the end of 2023 and represents the amount that has been embedded in the 2024 Test Year Forecast.

c) Integration savings of $86 million are sustainable and included in the 2024 Test Year Forecast and beyond. Please see response at Exhibit I.1.9-CCC-25 part d).

Interrogatory

Reference:

Ex. 1/T9/S1/p. 25

Question(s):

The evidence states, "The annual integration synergies of $86 million demonstrate the amalgamation Of EGD and Union provides ongoing benefits to customers. As those savings are passed on to customers in 2024, it is appropriate the corresponding net book value of integration costs of the assets used to provide continued safe and reliable services are included in rate base." Is EGI seeking to add the net book value to 2024 ratebase of all of its integration projects? If not, please identify those that are not in Attachment 1.

Response:

a) Please see response at Exhibit I.1.9-STAFF-22 part b).

ENBRIDGE GAS INC.

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 1, Tab 9, Schedule 1, p. 11 of 25

Question(s):

At page 11, EGI indicates that it has driven savings by aligning the use of contractors for specific work activities.

a) Please clarify what EGI means by aligning contractors for specific work activities. For instance, does EGI mean that internal resources no longer complete those work activities, or simply that the processes EGI uses to determine when contractors should be used for those tasks is now common across the company.

Response:

a) This initiative aligned the work that would be performed by contractors versus internal staff at Enbridge Gas. This resulted in a reduction of FTEs.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 1, Tab 9, Schedule 1, pp. 20, 24 of 25

Question(s):

At page 11, EGI indicates that it spent $252.2 million in capital expenditures related to integration efforts, which currently have an undepreciated balance of $178.5 million, and a 2024 revenue requirement impact of $34 million. At page 24, EGI states that the annual synergy savings as a result of integration are $86 million per year.

a) Does EGI track the synergy savings driven specifically by the investments made during the deferred rebasing period, versus how much of the synergy savings could have been achieved through integration without the capital expenditures?

b) If the answer to (a) is yes, please provide the amount of integration savings that were attributable to integration without the capital expenditures.

c) Does EGI track the relative impact of any specific capital expenditure related to integration? For instance, the customer information system had a capital expenditure cost of $X and drove $Y in sustainable synergies for ratepayers?

d) If the answer to (c) is yes, please provide the cost and benefits (in sustained synergy savings) of each project.

Response:

a) Enbridge Gas tracks synergy savings for the portfolio of initiatives as outlined in response at Exhibit I.1.2-CCC-25. Enbridge Gas does not track the integration synergy savings that could have been achieved without capital expenditures.

b) Please see part a).

c) Please see response at Exhibit I.1.2-CCC-25 for how initiatives were tracked in the portfolio.

d) Please see part c).

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 1, Tab 9, Schedule 1, Table 3, line 6 - *Central Functions*

Question(s):

a) Please confirm that compared to legacy costs, in 2022 EGI is saving $15.8 million as a result of centralized functions. Is this for both Union and EGI?

b) Please provide the legacy costs from 2015-2020 for services now centralized for Union and EGI, including each of utility in house services and centralized functions provided by EI.

c) Please provide explanatory notes and references to filings in prior cases.

d) Please provide the details of the services and costs of EI centralized services for 2015-2022. Reconcile to Intercorporate Services Agreement for 2022.

Response:

a) Confirmed, in 2022 Enbridge Gas saved $15.8 million as a result of synergy initiatives that were related to both EGD and Union.

b) Enbridge Gas believes that the reference to ‘Union and EGI’ above should read ‘Union, EGD and Enbridge Gas’ and the reference to ‘centralized functions provided by EI’ represents ‘Enbridge Inc. or Spectra Allocations’. Enbridge Gas has also extended the data range to 2015 to 2024 to address other requests. Please see Attachment 1 for the 2015 to 2024 costs.

c) Explanatory notes have been included in the response for part b). References to filings are listed in Table 1.

Table 1
Filing References

Year	EGD	Union	EGI

Notes:

Costs for 2015, 2016 and 2017 do not represent the CFCAM model costs found in Exhibit 4, Tab 4, Schedule 3, Table 3. Allocations models for Union Gas and EGD along with Central Functions resources in each company were different for those years. These costs should be utilized for illustrative purposes only.

In house costs for 2018 were included in the CFCAM model costs found in Exhibit 4, Tab 4, Schedule 3, Table 3 and Exhibit 4, Tab 4, Schedule 2, Table1, Line 5.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 1, Tab 9, Schedule 1, Page 21, Table 6

Question(s):

a) Please explain how Actual Overheads of $7.6 million for 2019 and $11.0 million for 2020 were determined.

b) Why are there no overheads shown after 2020?

Response:

a) The calculation of overheads for 2019 and 2020 is based on the historical EGD and Union overhead capitalization policies. These are provided at Exhibit 2, Tab 4, Schedule 2, pages 3 to 7. The actual overhead allocation rates to apply to projects were determined by rate zone and applied to all projects as the proportion of overheads relative to the total direct capital spend.

b) Enbridge Gas started allocating overheads at the project level starting in 2021. This is provided at Note 4 in Exhibit 1, Tab 9, Schedule 1, Table 6. Consequently, overheads are contained in the values for lines 1 to 6 from 2021 onwards.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 1, Tab 9, Page 24, Paragraph 50

Question(s):

Please file a table that shows the components of the $86 expected annual synergy savings by year over the 2024 to 2028 period.

Response:

Integration savings of $86 million are sustainable and included in the 2024 Test Year Forecast and beyond. Please see response at Exhibit I.1.9-CCC-25 part d).

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

1-9-1

Question(s):

With respect to integration savings:

a) [p.5] For each category listed in Table 2, please provide a breakdown of each specific initiative, detail the methodology used to calculate the savings, and provide the underlying calculations.

b) [p.5, 17] Please expand Tables 2, 3, 5 and 6 to include forecasts for 2024 to 2028.

c) Please provide the most recent internal reporting to Enbridge's senior management and Enbridge Inc. regarding integration savings.

Response:

a) Please see response at Exhibit I.1.9-CCC-25 parts a-c) for a listing of the integration initiatives, the associated qualitative and quantitative benefits, and the methodology to calculate these savings.

b) O&M integration savings of $86 million are sustainable and included in the 2024 Test Year Forecast. As provided at Exhibit 1, Tab 9, Schedule 1, page 16, there will be no incremental integration savings or costs beyond 2023 and therefore no incremental integration savings or costs forecasted for 2024 to 2028. For capital integration costs, the Company's proposal is that the net book value of these costs will be included in rate base in 2024 and be subject to recovery through rates going forward as these costs are funded through the integration synergies that have been achieved through the amalgamation of EGD and Union.

c) Please see response at Exhibit I.1.2-SEC-76, Attachment 2, page 8 for Enbridge Inc. Reporting on integration savings.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

1-9-1, p.21; 9-2-1, p.22

Question(s):

With respect to integration capital:

a) Please provide the 2024 revenue requirement, broken down into each major component (rate base, return on capital, depreciation, taxes), for all integration capital that Enbridge seeks to add to the rate base.

b) Please also provide the Tax Variance Deferral Account (TVDA) balance related to integration capital.

Response:

The following response has been updated to reflect the Capital Update provided at Exhibit 2, Tab 5, Schedule 4, filed on June 16, 2023. /u

a) Please see below for the 2024 forecast revenue requirement applicable to integration capital:

($ millions)	2024 Revenue Requirement	
Rate Base	112	/u
Depreciation (1)	15	/u
Interest Expense	3	/u
Return on Capital	5	/u
Income Tax	5	/u
Total (2)	28	/u

Notes:
(1) Depreciation per the revised depreciation rates proposed in Exhibit 2, Tab 5, Schedule 4, Attachment 1. /u
(2) Revenue requirement would be $47 million with existing depreciation rates reflected. /u

b) The forecast TVDA balance related to integration capital is approximately $6.8 million payable. The change in this balance from the original 2023 estimated ending balance is impacted by the mix of 2022 integration in-service actuals that differed from the 2022 original estimate, including the shift of the AWS project to 2023. This impact is partially offset by reductions to 2023 integration capital as part of the capital updates, including the deferral of the GTA REWS projects. /u

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

1-9-1

Question(s):

In addition to saving arising from integration activities, please detail all other productivity and efficiency measures that the applicant has taken since 2018 and plans to take through to the end of the test year. Please quantify those actual and forecast savings and explain the calculations.

Response:

Please see Table 1 for the productivity savings Enbridge Gas has achieved since 2018 and plans to take through to the end of the test year:

Table 1
EGI Productivity Savings

Line No.	Particulars ($millions)	2019 Actuals	2020 Actuals	2021 Actuals	2022 Actuals	2023 Bridge Year	2024 Test Year

*Process Optimization initiatives relate to changes in the way work is organized to achieve efficiencies. Please see Exhibit 4, Tab 4, Schedule 2, paragraph 16 for details of significant initiatives.
** Cost Rationalization relates to spend that could be eliminated.
*** Please see Exhibit 4, Tab 4, Schedule 2, paragraph 17 for further information on embedded productivity.

Similar to integration savings provided in response at Exhibit I.1.9-CCC-25, to calculate the productivity savings, each budget cycle, Enbridge Gas conducts a detailed review of savings that were achieved by the business. When sustainable savings are achieved, those amounts are removed from the budget as the costs are no longer applicable and tracked separately.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Vulnerable Energy Consumers Coalition (VECC)

Interrogatory

Reference:

Exhibit 1, Tab 9, Schedule 1, Tables 1, 2,3

Question(s):

a) Please clarify whether the "Potential" savings shown in Table 1 are net of integration costs and are calculated as the net total over 10 or 5 years?

b) Please clarify whether the savings shown in Tables 2 & 3 are net of the integration costs as shown in Table 5.

Response:

a) The "Potential" savings in Table 1 are not net of integration costs. The ranges in Table 1 were provided as filed in the MAADs Application[1], and contemplated a 10-year deferred rebasing term.

b) The savings shown in Tables 2 and 3 are not net of integration O&M costs. Enbridge Gas is not requesting recovery of the O&M costs.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedules 1-8

Question(s):

Enbridge Gas has submitted a detailed energy transition plan in this application. It has also sought approval for an Energy Transition Technology Fund ("ETTF") of $5 million per year, totaling $25 million over the 2024 to 2028 period to "advance and accelerate research, development, and commercialization of low-carbon technologies."

Please elaborate on how the energy transition plan and the ETTF (if approved) would help to mitigate the risks from energy transition faced by Enbridge Gas, specifically for the 2024-2028 period.

Response:

Enbridge Gas's Energy Transition Plan (ETP) and its associated objectives and proposals, as provided at Exhibit 1, Tab 10, Schedule 6, are intended to ensure continued progress towards Ontario's 2030 GHG emission reductions target, while managing pathway uncertainty; please see response at Exhibit I.1.10-STAFF-39 for further discussion on this topic. In addition, Enbridge Gas has taken many steps to minimize the risk of stranded assets, please see response at Exhibit I.1.10-STAFF-34 part a) for further details.

The evidence related to the Energy Transition Technology Fund in Exhibit 1, Tab 10, Schedule 7 will be addressed in Phase 2 of the proceeding as noted in Enbridge Gas's February 1, 2023 letter.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 3, pp. 4-12; Exhibit 1, Tab 10, Schedule 4, pp. 2-3, Exhibit 1, Tab 10, Schedule 6, pp. 1-8.

Question(s):

Enbridge Gas describes current provincial and federal climate policies impacting Enbridge Gas (federal - methane regulations, carbon pricing, Clean Fuel Regulation; provincial - Emissions Performance Standards). Enbridge Gas provides its energy transition forecasts for number of customers and average use, and notes that historically, it has only considered climate policies that have been implemented and that in this application it is accounting for known energy transition factors and will incorporate changes as policy signals become more certain. Enbridge Gas describes emerging federal, provincial, and municipal energy transition and climate change policies.

a) Have any of the policies described as “emerging” in Exh. 1, Tab 10, Schedule 6 been directly incorporated into Enbridge Gas’s forecasts for number of customers and average use? If so, please describe.

b) Please provide a description of the approach Enbridge Gas plans to take during the rebasing term to adapt its investments and expenditures as a result of these emerging policies.

Response:

a) No, Enbridge Gas has not incorporated the referenced emerging climate policies directly into the customer forecast and average use assumptions. As summarized in Exhibit 1, Tab 10, Schedule 6, pages 8 and 12, there remains a lack of detail and certainty on how emerging government policies on all levels (federal, provincial and municipal) will be implemented; however, as provided at Exhibit 1, Tab 10, Schedule 4, page 5, Enbridge Gas has included adjustments to the customer forecasts based on market trends, including net-zero buildings in new construction, lower customer additions for replacement conversions and existing customers replacing equipment with non-gas equipment at end of life.

b) Enbridge Gas keeps abreast of emerging government policies, plans and targets as well as builder and market trends. Over the rebasing term, Enbridge Gas will continue to monitor external energy transition signals and stay informed on energy transition plans via external stakeholder engagements (i.e., with municipalities, builders, contract customers etc.). Enbridge Gas will continue to monitor and consider the following emerging trends in its future forecasting and planning:

- Emerging federal, provincial, municipal, and indigenous policies (laws, regulations, codes and standards), as well as targets and plans related to climate change and energy transition.

- Customer trends and market information obtained via engagement with customers and other stakeholders

Enbridge Gas will use these external signals as inputs into the demand forecast process as they become more certain, and they will form the basis for energy transition assumptions that are incorporated in the forecast and planning processes. As noted in Exhibit 1, Tab 10, Schedule 4, energy transition assumptions are factored into Average Use Forecast, Customer Forecast, Volume Forecast, Design Hour and Design Day for this rebasing period. Enbridge Gas will review these demand forecast elements annually, or as appropriate based on external factors, to determine if the energy transition assumptions need to be adjusted.

The demand forecast and design elements impact Enbridge Gas's Asset Management Plan, gas supply planning and rate setting, all of which impact the Company's investments and expenditures.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 4, pp.3-4; Exhibit 3, Tab 2, Schedule 5, p.9

Question(s):

Enbridge Gas describes its Energy Transition assumptions for average use. Enbridge Gas notes that its average use forecast includes adjustments for carbon pricing. Enbridge Gas notes that, as a result of the energy transition adjustment to the customer forecast, the 2024 Test Year general service annual volume forecast is approximately 2,899,408 cubic meters per year lower than would otherwise be the case. However, (Exhibit 3) Enbridge Gas also notes that natural gas price was not statistically significant in the residential average use forecasting model, thus was excluded as a forecasting variable.

a) Do the Energy Transition assumptions for average use described in this section (i.e., the inclusion of carbon pricing, but no inclusion of other potential factors such as future energy efficiency of codes and standards) in this section apply to both the 2024 Test Year forecast and the longer-term demand forecast through 2032 that is used to develop Enbridge Gas's Asset Management Plan (AMP)? If there are differences in the assumptions regarding average use in the longer-term forecast, please describe.

b) Please confirm that the forecasting adjustments described for carbon pricing are only used for the average use forecast for non-residential customers, i.e. the assumption is that residential average use is not affected by cost of natural gas, including the rising carbon price.

Response:

Please note that the 2,899,408 cubic meters volume reduction as a result of energy transition adjustment to the customer forecast that was stated in Exhibit 1, Tab 10, Schedule 4, pages 3 to 4, is incorrect. Please see response at Exhibit I.1.10-STAFF-31, Table 7 for the corrected data.

a) The average use forecast is used to develop Enbridge Gas's annual volume forecast, but the annual volume forecast is not used to develop Enbridge Gas's Asset Management Plan (AMP). Energy transition assumptions for average use apply to both the 2024 Test Year forecast and the longer-term annual volume forecast through 2032.

   Distribution Reinforcement Projects in the AMP include energy transition effects on customer count and design hour demand. This process informs the reinforcements identified in the AMP and is used on specific project scope and justifications. The assets in the AMP are based on the design day and the design hour forecasts.

b) Enbridge Gas initially anticipated that natural gas prices (including the rising carbon price) would affect residential average use. During the variable selection process, natural gas prices were included in all the models (5 residential and 5 non-residential models), but they were found to be statistically significant only for EGD rate zone non-residential models (3 out of 5 models). Therefore, Enbridge Gas's non-residential average use forecast is partially affected by the cost of natural gas, including the rising carbon price but the residential average use forecast is not.

ENBRIDGE GAS INC.

Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 4, p. 4; Exhibit 2, Tab 6, Schedule 2, Table 5.1.10-1 and Appendices A and B; Exhibit 4, Tab 2, Schedule 6, p. 18

Question(s):

In exhibits 1.10.4 and 4.2.6, Enbridge Gas proposes to conduct a Hydrogen Blending Grid Study for a total of $12 million.

In Exhibit 2.6.2, Table 5.1.10-1, Enbridge Gas proposes to conduct a Hydrogen Feasibility Study for a total of $15.5 million. In Appendix A of this exhibit, Enbridge Gas proposes to conduct a Hydrogen Feasibility Study for a total of $12 million. In Appendix B of this exhibit, Enbridge Gas proposes to conduct a Hydrogen Feasibility Study for a total of $15.5 million.

a) Please confirm that “Hydrogen Blending Grid Study” and “Hydrogen Feasibility Study” are different names for the same study. If not, please explain the differences between these two studies.

b) If question (a) is confirmed, please reconcile the cost estimates of $12 million and $15.5 million.

Response:

a) Confirmed.

b) Please see the footnote under Table 5.1.10-1 provided at Exhibit 2, Tab 6, Schedule 2, Page 75 which indicates costs reflected in this table include overhead allocation.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 4, pp.5-7; Exhibit 3, Tab 2, Schedule 5, p. 7; Exhibit 3, Tab 2, Schedule 6, pp. 4, 9; EB-2021-0002 Decision and Order, p.3; Enbridge Gas Home Efficiency Rebate Plus website (https://www.enbridgegas.com/residential/rebates-energy-conservation/home-efficiency-rebate-plus)

Question(s):

Enbridge Gas discusses the energy transition assumptions embedded in its customer additions forecast (Table 2). Enbridge Gas notes that based on market trends, Enbridge Gas assumed that on a voluntary basis, a portion of new buildings would not be serviced by natural gas, and a portion of existing natural gas customers would choose to replace heating equipment reaching end of life with non-gas alternatives.

a) Please provide more detail on the market trends that informed Enbridge Gas's energy transition assumptions in Table 2.

b) Please provide a copy of the 2020 Residential: Single Family Natural Gas End Use Study used to inform the assumption that 94% and 82% of customers were likely to replace their equipment with natural gas space and water heating equipment, respectively.

c) How much emphasis is Enbridge Gas placing on these study results in developing its energy transition assumptions in Table 2, given that certain key variables, such as the cost of natural gas including the carbon price, were different in 2020 than they are in 2023 and will be at the end of this rebasing period?

d) Please describe how Enbridge Gas has considered the rising carbon price in its consideration of forecasts as they relate to customer additions.

e) Has Enbridge Gas considered the likely impact of building code changes (including the new Canadian Energy model code discussed in Exhibit 3) on its assumptions for the portion of new buildings that would be serviced by natural gas?

f) Why does Enbridge Gas assume that the rate of customer additions for replacement customers (existing homes and businesses who switch from other energy sources to natural gas) does not begin to decline until 2030?

g) The Home Efficiency Rebate Plus program (a modified version of the Government of Canada's Greener Homes Grant program that is delivered by Enbridge Gas in Ontario and is available to Enbridge Gas customers and non-Enbridge Gas customers) provides significant incentives for existing buildings to install electric space heating systems (ground source and air source heat pumps) intended to service the entire home. Per the OEB's EB-2021-0002 decision, Enbridge Gas customers are not required to remain an Enbridge Gas customer after participating in this program. What assumptions regarding the impact of the Home Efficiency Rebate Plus program are included in Enbridge Gas's customer additions forecast for replacement customers (existing homes and businesses who switch from other energy sources to natural gas) and its forecast for shrinkage of existing Enbridge Gas customers?

h) Has Enbridge Gas performed any sensitivity analysis regarding how its forecast of year-over-year change to average number of customers (customer additions minus shrinkage customers) would impact its forecast spending in the 2023-2032 AMP?, e.g. what would be the impact on capital requirements in the AMP of a 25%, 50%, or 100% reduction in net new customers, relative to the forecast?

Response:

a) For the new construction customer addition forecast, Enbridge Gas reviewed trends related to net-zero energy ready buildings and types of heating systems being installed. Enbridge Gas relied upon results published in the Canadian Home Builders' Association May 2021 Report "CHBA Net Zero Home Labelling Program Summary Report – 2020" to assess the percentage of homes in Ontario voluntarily being built to a net-zero standard as of 2020, and the percentage of net-zero homes being supplied with natural gas. A summary version of this report is provided in response at Attachment 1.

   For the existing customer forecast, Enbridge Gas reviewed the 2020 Residential Single Family Natural Gas End Use study provided in response at Exhibit I.1.10-GEC-7, Attachment 3, for results related to the fuel source of new furnaces and water heaters and the number of natural gas appliances.

   Enbridge Gas did not have market trend reports related to existing buildings that are not currently serviced by natural gas, and therefore assumed that conversions to natural gas from this segment would continue at the current pace until 2029. Enbridge Gas assumed that buildings in this segment were likely to be heated by oil or propane, older, and less energy efficient, and would require extensive retrofitting prior to fuel-switching to electricity in preference of natural gas. For further details please see the response at Exhibit I.1.10-GEC-7 parts a) and c) iii.

b) Please see response at Exhibit I.1.10-GEC-7, Attachment 3.

c) Enbridge Gas considers the market trend information referred to in response to part a) representative of the best available information at the time of forecasting. Enbridge Gas's forecasting process is undertaken on an annual basis to reflect changes in market conditions and energy and climate related policies and programs and the impact they may have on forecasting variables. Enbridge Gas will continue to review market trends and policies to update forecasting inputs and energy transition assumptions.

   As an example, in the 2022 Enbridge Brand Health Study provided in response at Exhibit I.1.6-SEC-83 Attachment 1, pages 84 to 86, residential customers were asked whether they expected their natural gas use to change in the next 5 years. The majority of respondents indicated they expect their natural gas use to remain the same (71%), while 14% indicated they expect their natural gas use to increase. Among those who indicated they expect their natural gas use to increase, 41% indicated they were likely to purchase more natural gas appliances. With respect to the 13% who expect their natural gas use to decrease, only 25% of these respondents indicated it was likely to be due to fuel-switching to another energy source. Most indicated a decrease would likely be due to being more energy efficient (e.g., temperatures setback and more efficient equipment).

d) Enbridge Gas's proposed customer additions forecast is explained in detail at Exhibit 3, Tab 2, Schedule 6. The customer additions forecast does not consider carbon pricing. Carbon pricing is taken into account in the average use forecast.

e) With respect to anticipated changes in the building code and the customer forecast, Enbridge Gas assumed that by 2030 the Ontario Building Code (harmonized with the National Energy Code of Canada for Buildings) would require new buildings to be built according to a net-zero energy ready standard, and that gas equipment (I.e., fueled by hydrogen or methane or mixtures) would be available for use in net-zero energy ready buildings. It was assumed that 10 percent of builders in 2030 would voluntarily choose not to service these buildings with gas. Enbridge Gas used the results of the 2021 CHBA Net-Zero labelling report referred to in response to part a) and interpolated a percentage between 2023 and 2030 to estimate the percentage of new construction buildings that would voluntarily choose not to connect to the gas grid and extended this trend beyond 2030. Please see response at Exhibit I.1.10-STAFF-31 Attachment 1, Table 5 for the adjustment to the new construction customer addition forecast.

f) Please see response at Exhibit I.1.10-GEC-7 part a) and c) iii.

g) Details of the Home Efficiency Rebate Plus (HER+) Program were not sufficiently known at the time of forecasting, so it was not specifically considered in Enbridge Gas's energy transition assumptions related to existing customers, as described in the response to a) above; however, the HER+ Program represents an example of the type of incentives that Enbridge Gas assumed may be available that would encourage voluntary fuel switching amongst existing customers starting in 2026.

h) Enbridge Gas has not completed any sensitivity analysis regarding how its forecasted year-over-year changes to the average number of customers would impact its forecasted AMP spending. Enbridge Gas did not complete this sensitivity analysis because to obtain a meaningful understanding of how greater reductions, like 25% or 50%, would impact the forecasted AMP spending, Enbridge Gas would require in-depth knowledge of where the greater reductions would occur in its service area and when. These customer reductions would also need to be considered in tandem with any other energy transition related changes that might occur. For example, a reduction in customer numbers will not necessarily translate into a corresponding reduction in capital spending. For example, in a situation where hydrogen blending is increased in the distribution system, the increased volume of gas required could at least partially offset the impact of reduced customer numbers. Please see response at Exhibit.I.2.6-Staff-70b for additional discussion on the possible energy transition scenarios that could impact the AMP in various ways. Without this more in-depth understanding of where and when future changes to customer additions and the system could occur, a sensitivity analysis would be of little to no value in understanding changes to AMP spending. The second reason that Enbridge Gas did not complete this sensitivity is, even if Enbridge Gas wanted to guess as to where the reductions might occur, completing this analysis would require the hydraulic models to be updated or rebuilt with the geo-specific and timing information to understand which growth projects and/or IRP projects would not be required. This process is time consuming and would take several months to complete.

/u

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 4, pp.7-8

Question(s):

Enbridge Gas describes its Energy Transition assumptions in the volume forecast. Enbridge Gas notes that, as a result of the energy transition adjustment to the customer forecast, the 2024 Test Year general service annual volume forecast is approximately 2,899,408 cubic meters per year lower than would otherwise be the case.

a) Does the reduction in 2024 Test Year annual volume of 2,899,408 cubic meters per year in the general service annual volume forecast in the 2024 Test Year forecast derive only from the changes in number of customers, or does the volume reduction also incorporate the impact of the carbon pricing assumptions on average annual use?

b) Please provide the annual volume forecast for each year through 2032 for general service customers that is used in the longer-term demand forecast used to develop Enbridge Gas's AMP, and the change in annual volumes in these years due to Energy Transition assumptions.

c) Please provide the annual greenhouse gas emissions associated with the annual volume forecast for general service customers for each year through 2032, first assuming these volumes are 100% conventional natural gas, and second, incorporating Enbridge Gas's assumptions as to what percentage of volumes may come from lower-carbon supply sources (please provide the rationale for these assumptions).

Response:

a) The reduction in the 2024 Test Year annual volume of 2,889,408 cubic meters in the general service annual volume forecast is incorrect. Please see response at Exhibit I.1.10-STAFF 31 for the corrected impact. The volume reduction incorporates both the changes in the number of customers and the impact of the carbon pricing assumption on the average use forecast.

b) Enbridge Gas's AMP does not use the annual volume forecast. However, please see response at Exhibit I.1.10-STAFF 31, Table 1 for the annual volume forecast for each year through 2032 and Table 7 for the change in annual volumes in these years due to energy transition assumptions.

c) Using the data provided at Exhibit I.1.10-STAFF 31, Tables 1 and 7, the annual greenhouse gas (GHG) emissions associated with the annual volume forecast for general service customers, before accounting for energy transition assumptions, are shown in Table 1, column (a) below. The emissions savings associated with the adjustments in annual volumes in these years due to energy transition assumptions is shown in Table 1, column (b) below. The annual GHG emissions associated with the annual volume forecast for general service customers while incorporating change due to energy transition assumptions is shown in Table 1, column (c) below. The GHG emissions shown in Table 1 are based on the assumption that 100% of the gas volumes are natural gas.

Table 1
Annual GHG emissions of volume forecast for general service customers (million tCO_2e)

Year	Annual GHG Emissions	Emissions Savings	Annual GHG Emissions including Energy Transition
	(a)	(b)	(c) = (a)-(b)
2024	30.317	0.002	30.315
2025	30.312	0.004	30.308
2026	30.306	0.012	30.287
2027	30.298	0.024	30.274
2028	30.282	0.027	30.256
2029	30.261	0.029	30.232
2030	30.233	0.031	30.202
2031	30.275	0.032	30.243
2032	30.313	0.035	30.279

The emissions reductions as a result of energy transition assumptions shown in Table 1 above include forecast natural gas volume reductions as a result of number of customers and the impact of the carbon pricing assumption on the average use forecast.

Table 2 shows forecast GHG emissions of general service customers incorporating Low Carbon Energy Project (LCEP) Phase 1 estimated hydrogen volumes at continuous 2% blend. Impacts of RNG supply has not been included. This issue will be addressed in Phase 2 of the proceeding in accordance with the OEB's Decision on Issues List dated January 27, 2023. Please see response at Exhibit I.1.10-ED-40 for gaseous fuel consumption forecast assumptions. Enbridge Gas assumes that GHG emissions based on the annual volume forecast for general service customers will be lower than shown on the forecast below once assumptions on RNG and LECP Phase 2 can be included.

Table 2
Annual GHG emissions of volume forecast for general service customers incorporating LCEP Phase 1 area hydrogen blend of 2% (million tCO2e)

Year	Emissions
2024	30.315
2025	30.308
2026	30.287
2027	30.274
2028	30.256
2029	30.232
2030	30.201
2031	30.243
2032	30.278

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 4, pp.7-8; Exhibit 3, Tab 2, Schedule 7, pp. 3-4; EB-2021-0002, Decision and Order (DSM Decision), November 15, 2022; 2021 Natural Gas Demand Side Management Annual Verification Report, November 1, 2022, p.4 & p.6.

Question(s):

Enbridge Gas discusses adjustments to its volume forecast to adjust for future demand side management (DSM) Plan activities.

a) Please discuss why Enbridge Gas's 2024 Test Year DSM volumes are lower than the verified first year natural gas savings from 2021 DSM programs in the 2021 Annual Verification Report (93,890,052 m3).

b) Please discuss how the proposed 2023 Bridge Year and 2024 DSM Test Year forecast volumes reconcile with the recently approved DSM plan that includes materially increased DSM budgets and correspondingly higher natural gas savings targets beginning in 2023 and increasing in 2024 and 2025.

c) Please discuss what updates or assumptions, if any, Enbridge Gas has made or is proposing to its load forecasting methodology (including the longer-term demand forecast through 2032 used to develop Enbridge Gas's AMP) in response to the OEB's DSM Decision that includes expectations from the OEB that DSM programs result in more meaningful reductions in overall natural gas sales volumes, and that approved DSM programs show progress in reducing overall natural gas usage while delivering benefits to ratepayers, including

- The establishment of an End-of-Term Natural Gas Reduction Incentive (p. 3 of DSM Decision) during the current DSM plan term that runs to the end of 2025;

- The expectation that "the next DSM Plan will result in meaningful natural gas savings each year between 2026 and 2030 … the OEB expects that, at a minimum, the level of natural gas savings from DSM programs during the next multi-year term will be the equivalent of at least 0.6% of sales in 2026, 0.8% of sales in 2027 and 1.0% of sales in each year from 2028 through to the end of

2030, relative to the prior year on a weather normalized basis." (p. 4 of the DSM Decision).

Response:

a) The 2021 DSM results are not in scope for this proceeding and are based on two distinct scorecard structures for each of the legacy utilities. Additionally, the 2021 amounts are on an actual basis rather than forecast and reflect differences in baselines, among a multitude of other differences. The 2024 Test Year DSM volumes were based on the DSM Plan filing (EB-2021-0002) that contains a fully amalgamated scorecard structure, differing programming, differing scorecard metrics among many other differences. The referenced 2024 Test Year volumes also encompass only general service rate classes, whereas the referenced DSM annual verification report covers the entire DSM portfolio and all rate classes. The DSM Plan was approved by the OEB in November 2022 in EB-2021-0002. The Company declines to respond to reconciliation requests from previous year's actuals results for DSM as this would be duplicative of the DSM Plan proceeding.

b) Please see response to part c).

c) The Company has received several similar interrogatories related to the OEB DSM Plan Decision in EB-2021-0002 ("DSM Plan decision").

   The DSM Plan Decision included increases in the proposed DSM Plan budget in the 2023 through 2025 term. The increased budget is reflected in the updated evidence filed March 8, 2023.

   Some interested parties queried 'materially higher' forecasts between the DSM Plan decision and the original DSM Plan and/or questioned the impact of this on this Application and/or requested updates to the evidence based on changes to the volume forecast. The Company does not plan to update the evidence to reflect the impact of differing DSM Plan targets on the volume forecast, as the change is not material as described below.

   The Company notes that on an annual target volume basis the difference between the 2024 as-filed DSM Plan target and the DSM Plan Decision 2024 target is cumulatively 8.8 million m^3 across all rate classes. The total general service normalized volumes for 2024 Test Year as provided at Exhibit 3, Tab 2, Schedule 7, Attachment 1 are 15,688 million m^3. The total contract volumes for the 2024 Test Year as shown at Exhibit 3, Tab 2, Schedule 8, Attachment 1 are an additional 12,235 million m^3. Any differences between the DSM Plan decision and the original DSM Plan are not materially higher in the context of this proceeding. Similarly, any differences in such a forecast for 2025 (the end of the DSM term) using the as filed DSM Plan targets versus the DSM Plan decision would also not be material.

Some interested parties queried the impact of direction for the next DSM Plan filing for the 2026 to 2030 term, including questioning if the Rebasing Application 'complies' with the DSM Plan Decision, stating that the OEB required reductions in net natural gas volumes starting in 2026. The Company interprets the DSM Plan Decision as laying out a target for the Company to consider, among myriad other items, as an input into the next DSM Plan Application, and one that has yet to be adjudicated by the OEB. The DSM Plan Decision specifically notes an expectation that the Stakeholder Advisor Group would provide input into the next DSM Plan Application. It also sets a clear expectation that an achievable potential study ("future APS") should be performed by OEB Staff and is to be a key input into the next DSM Plan. The future APS is required to have various scenarios, at 0.5%, 1.0% and 1.5% percentage system throughput reduction, among other things. This indicates that the OEB expects to consider a wide range of outcomes in the next DSM Plan proceeding. In any event, the OEB has not reviewed the budgets associated with the next DSM Plan. Enbridge Gas views the direction from the DSM Plan Decision for the future DSM Plan term as preliminary and subject to future determinations, not as something the Company needs to 'comply' with in this application.

Some interested parties queried the impact of the OEB-approved End of Term Natural Gas Reduction Incentive ("EOTNGRI") in the DSM Plan Decision and whether this would have any impact on the load forecasting methodology or long-term forecast that underpins the Company's Asset Management Plan. The EOTNGRI is a shareholder incentive mechanism intended to align the Company's interests with broad policy goals. The EOTNGRI does not change the OEB-approved targets for the DSM Plan term. The Company also notes that there many factors beyond the DSM Plan that would have an impact on the EOTNGRI, including but not limited to: economic growth in the province, the number of new customers that choose to attach to the gas system, the amount of gas-fired generation used during the measured period, significant changes in usage by large gas volume consumers and population growth within the Company's franchise areas. Finally, the EOTNGRI covers the period from 2022 to 2025 and there is no indication presently that this incentive mechanism will persist beyond this period, so making any additional adjustments to longer-term forecasts or methodologies would be premature.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Exhibit 1, Tab 10, Schedule 4, p.8

Question(s):

Enbridge Gas notes that it did not make any additional energy transition-related adjustments in the distribution contract market forecast and that energy transition impacts are inherent and specific to customers in the proposed forecast methodology.

a) Please confirm that the methodology used to develop customer and volume forecasts for the distribution contract market extends beyond the 2024 test year to cover the length of the AMP (through 2032).

b) Please provide the annual volume forecast for each year through 2032 for distribution contract customers that is used in the longer-term demand forecast used to develop Enbridge Gas's AMP.

c) Please provide the annual greenhouse gas emissions associated with these volumes, first assuming these volumes are 100% conventional natural gas, and second, incorporating Enbridge Gas's assumptions as to what percentage of volumes may come from lower-carbon supply sources (please provide the rationale for these assumptions).

d) For the power generation sector specifically, what are the annual volume forecasts for each year through 2032? Has Enbridge Gas considered how provincial or federal energy transition policy (e.g, the federal government's commitment that Canada's electricity generation would be net zero by 2035) are likely to impact these volumes?

Response:

a) Confirmed.

b) The annual volume forecast for distribution contract market customers for 2023 to 2028 has been provided in Attachment 1. The annual volume forecast is not used to develop Enbridge Gas's AMP.

c) The annual greenhouse gas emissions associated with the volume forecast for distribution contract market customers for 2023 to 2028 are provided in Table 1. Enbridge Gas has not estimated the percentage of low carbon gas within the distribution contract forecast volumes.

Table 1
Greenhouse gas emissions associated with forecast volume for distribution contract market customers (million tCO_2e)

Line No.	Year	Annual Emissions
	(a)	(b)
1	2023	23.24
2	2024	23.64
3	2025	24.07
4	2026	25.68
5	2027	25.69
6	2028	25.67

d) The annual volume forecast for natural gas fired power generation for 2023 to 2028 has been provided in Table 2. These volumes are based on customer specific forecasts developed as part of the distribution contract market as provided at Exhibit 3, Tab 2, Schedule 8.

Enbridge Gas is following the development of the proposed federal Clean Electricity Regulations (CER), which is intended to drive progress towards a net-zero electricity grid by 2035. To support affordability and reliability while achieving net zero, Environment and Climate Change Canada's (ECCC's) Proposed Frame for Clean Electricity Regulation[1] has proposed a technology neutral and not prescriptive approach, which will allow solutions such as carbon capture and storage, co-firing fossil fuels with low-carbon fuels or switching to low-carbon fuels to achieve compliance. Additionally, ECCC is also proposing to allow units commissioned before 2025 to become subject to the CER at the end of their prescribed life, at which point it is proposed they may be able to provide backup to variable renewable electricity under certain conditions that have yet to be determined. This may allow units to operate using un-abated natural gas past 2035. Based on the proposed compliance flexibility, and ability for natural gas fired power generation to operate

[1] Government of Canada. (2022, July 26). Proposed Frame for the Clean Electricity Regulations. https://www.canada.ca/en/environment-climate-change/services/canadian-environmental-protection-act-registry/publications/proposed-frame-clean-electricity-regulations.html

beyond 2035, Enbridge Gas is currently unable to forecast potential impacts of the CER on power generation sector volumes.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 4, p. 8 and Exhibit 3, Tab 2, Schedule 6, p. 8

Question(s):

The 2024 customer additions forecast reflects an adjustment of 321 fewer general service customer additions as a result of energy transition assumptions. As a result of the energy transition adjustment to the customer forecast, the 2024 Test Year general service annual volume forecast is approximately 2,899,408 cubic metres per year lower than would otherwise be the case.

Please state the assumptions and explain the methodology used to reflect an adjustment of 321 fewer general customer additions in the 2024 customer forecast and the resulting reduction of approximately 2.9 million cubic metres in the 2024 general service annual volume forecast.

Response:

The adjustment of 321 fewer customer additions in the 2024 Test Year customer forecast is correct; however, the resulting reduction of 2.9 million cubic meters to the 2024 Test Year general service annual volume forecast is incorrect.

The volumetric impact of 321 fewer customer additions is a reduction to volumes of 1,062,274 cubic meters. Please see Attachment 1, Tables 3 and 7 for a summary of the aggregated energy transition adjustments to forecasted customers and volumes for the period of 2024 to 2032. Underlying assumptions used to determine the energy transition adjustments to customers and volumes are detailed in Table 2. Each assumption has a separate impact on customers and volumes and these individual impacts are included in Attachment 1, Tables 4 to 6 and Tables 8 to 10 respectively.

Existing customers (unlocks), new construction customer additions, replacement customer additions and average use forecast used to determine the related energy transition assumptions impact are included in Attachment 1, Tables 11 to 14.

Also included in Attachment 1, Table 1 is Enbridge Gas's annual volume forecast (general service) for the period of 2024 to 2032.

A summary of the tables included in Attachment 1 is provided below:

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 4, pp.8-11

Question(s):

Enbridge Gas describes energy transition assumptions used for design hour and design day.

a) Please provide more details or cross-references as to how the peak hour trends from the ETSA Reference Case Scenario were used to develop the design hour adjustment factors in Table 3, and how these factors incorporate impacts from future DSM programing, carbon pricing and natural gas commodity pricing, building performance and appliance efficiency improvements for existing customers.

b) Please confirm that these adjustments were applied only to the forecasts of design hour and design day demand, not the annual volume forecasts.

Response:

a) Please see response at Exhibit I.1.10-SEC-20.

b) Confirmed. The adjustment factors derived from the ETSA Reference Case scenario were only applied to the design hour forecast, which are used to inform design day forecast. No direct adjustment factors were applied to the design day forecasts. The annual volume forecast did not apply the design hour demand adjustment factors derived from the ETSA Reference Case scenario.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 4, pp.13-14

Question(s):

Enbridge Gas notes that changes to its design hour process and inclusion of energy transition factors resulted in reduced system needs and fewer reinforcements, resulting in a reduction of approximately $66 million excluding overheads, to the Distribution Reinforcement Capital forecast in the current AMP relative to the previously filed AMP.

Please provide more details on these reductions; e.g., which potential projects were avoided, deferred, or downsized, and how did the changes to the design hour process and inclusion of energy transition factors specifically contribute to these changes in the AMP?

Response:

The sum of the changes to design hour process and inclusion of energy transition factors resulted in the elimination of some previously identified projects including but not limited to:

- York Region Reinforcement (Phase 1-5) for approximately $52.5 million.
- Penetanguishene Reinforcement for approximately $12.1 million.
- Thornton Reinforcement for approximately $11.1 million.

The harmonization of the design hour demand process provided at Exhibit 4 Tab 2 Schedule 3 combined with the energy transition factors provided at Exhibit 1 Tab 10 Schedule 4 had the result of reducing the peak hour demand forecast, as shown in Exhibit 1, Tab 10, Schedule 4, Figure 3: Effects of Energy Transition Assumptions on the Design Hour Demand. As a result, previously identified projects were no longer required or the required in service date was deferred.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 4, p. 13-14, 18-19, Exhibit 1, Tab 15, Schedule 1, p. 1

Question(s):

Enbridge Gas discusses how the AMP, including the growth asset class incorporates energy transition assumptions. Enbridge Gas notes the increased risk of stranded assets from energy transition and has proposed changes to its deemed capital structure. Enbridge Gas further requests approval of its harmonized customer connection policies.

a) Please describe how Enbridge Gas has considered and attempted to mitigate the risks of stranded assets associated with the proposed capital expenditures identified in its AMP (particularly growth-related capital expenditures including customer connections and distribution/transmission system reinforcement/expansion projects, but also considering system renewal expenditures to extend the service life of assets), related to uncertainty in future volumes or number of customers arising from the energy transition.

b) In Enbridge Gas's opinion, should ratepayers bear 100% of the cost recoveries related to stranded assets?

c) Has Enbridge Gas considered whether the proposal to increase Enbridge Gas's equity ratio may work at cross-purposes to the intent of managing energy transition risk, by increasing rates and potentially increasing the risk of customers exiting the natural gas system?

d) Has Enbridge Gas given consideration to adjustments to its customer connection policies to mitigate the risk of stranded assets associated with new customer connections who may leave the natural gas system before Enbridge's investment is recovered, e.g., by reducing the customer revenue horizon, requiring greater upfront customer contributions, eliminating the free service allowance for residential infills, introducing exit fees for new customers, etc.? If so, please provide details.

Response:

a) Enbridge Gas's proposed 2024 to 2028 AMP capital expenditures are predicated on fulfilling its obligation to (1) maintain a safe and reliable system, (2) connect customers based on OEB-approved connection policies and (3) implement IRP alternatives where technically and economically feasible. Enbridge Gas acknowledges that there exists some uncertainty about how the energy transition will unfold in Ontario; however, this does not absolve Enbridge Gas from the aforementioned obligations, especially when, despite pathway uncertainty, a project's underlying need/constraint has a high degree of certainty (e.g., minimum five-year demand forecast) and /or there is an absence of other technically or economically feasible alternatives.

   Enbridge Gas has taken many steps to mitigate the risk of stranded assets associated with the proposed capital expenditures within and beyond the five-year regulatory plan period. These include:

   - Completing an Energy Transition Scenario Analysis (ETSA) to understand the impacts of energy transition and the associated climate policies on natural gas demand in Enbridge Gas's distribution system.

   - Commissioning the Pathways to Net Zero Emissions in Ontario Study, conducted by Guidehouse to understand how Enbridge Gas's system could play a role in a net-zero future. The study built upon the ETSA work and found that a Diversified scenario achieves net zero with significant savings and more reliability, relative to an electrification scenario. The Diversified scenario would also increase the need for pipeline infrastructure to deliver large quantities of low carbon fuels like hydrogen and RNG. Please see Exhibit 1, Tab 10, Schedule 5.

   - Ongoing review and incorporation of energy transition assumptions into the demand forecasting process for new construction and existing customers replacing gas appliances and updates to annual and peak demand for gas. Please see Exhibit 1, Tab 10, Schedule 4, Table 2.

   - Ongoing updates to the asset management plan to respond to a changing pace of energy transition and to ensure that facilities projects' underlying needs/constraints (e.g., minimum five-year demand forecast) have a high degree of certainty when they are brought forward for approval. Please see Exhibit 1, Tab 10, Schedule 4, paragraph 37.

   - Incorporation of the IRP framework into the asset management process to defer or avoid new infrastructure, where possible, due to uncertainty related to energy transition. Please see Exhibit 1, Tab 10, Schedule 4, paragraph 43.

- Enhancements to the Distribution Integrity Management Program will allow the Company to further optimize its vintage steel main replacement program. Please see Exhibit 1, Tab 13, Schedule 3.

- Ongoing monitoring of Federal/ Provincial/Municipal policy across all sectors, including buildings, industry, transportation, and electricity generation and policies supporting energy efficiency, electrification, low carbon fuels and CCUS.

- As provided at Exhibit 1, Tab 10, Schedule 6, paragraph 106, Enbridge Gas will seek to understand how the Ontario government's Energy Transition and Electrification panel work will inform the Ontario government's energy transition policy and consequently the long-term viability of Enbridge Gas's assets. The Company has highlighted to the panel, the resiliency, reliability and future value of Ontario's 150,000 kms of underground gas storage, transmission and distribution assets in relation to the future cost of providing equivalent resiliency and reliability from a largely above ground electric transmission and distribution system. Enbridge Gas supports the panel's focus on integrating gas and electricity system planning and believes in the prudence of programs like the Ontario government's Clean Home Heating program that offers incentives for installation of heat pumps with smart controls in gas heated homes.

b) Yes. It is Enbridge Gas's view that the company should fully recover the costs of prudently invested capital. As provided in response at Exhibit I.1.10-SEC-28, Enbridge Gas has shown that in 2021, $16 billion of invested capital in the gas storage, transmission and distribution system delivers over four times the peak capacity delivered by the $25 billion invested in the electricity distribution system. The *current* unit cost of invested capital to deliver peak capacity in the form of natural gas is a quarter of that for electricity. Also, the underground gas system is more resilient than the largely above ground electricity system in Ontario.

   Enbridge Gas has invested shareholder capital to serve its customers under a regulatory compact that allows the Company to earn a fair rate of return and for the recovery of prudently invested capital through the rates charged to its customers. Enbridge Gas expects its underground storage, transmission and distribution assets to be used or useful for the foreseeable future due to their current capacity to deliver vast amounts of energy annually and on a peak basis, inherent resiliency and the low cost of connecting to the gas system.

   Enbridge Gas expects to fully recover from its customers the cost of prudently invested long-lived capital and operating and maintenance costs of providing safe, reliable and affordable energy to them. Increasing the fixed charges to connect to the system as proposed in this Application will provide cost recovery even if the amount of natural gas consumed is gradually displaced by non-emitting electricity.

Should the government institute a policy mandating disconnection from the gas system, the Company expects that it will accelerate recovery of its invested capital through regulatory measures such as higher depreciation rates and other tools including cost allocation changes to reflect a changing customer mix over time.

c) Enbridge Gas's perspective is that the increase in equity thickness mitigates the risk of investors attributing higher risk premiums with consequential impacts on the Company's cost of capital and more significant impact on customer rates.

d) Enbridge Gas is currently not experiencing a trend towards customers leaving the system nor does it have information suggesting that existing customers intend to leave the system. As noted above, Enbridge Gas is supportive of hybrid heating technologies which can reduce customers' annual GHG emissions by pairing non-emitting electricity with natural gas use to meet peak heating demands. Enbridge Gas's proposed connections policies, including the free service allowance for in-fills are established in such a manner as to ensure compliance with E.B.O 188 and the underlying principle that new customer revenues are sufficient to support their costs and do not impact the rates of existing customers. In addition, feasibility parameters such as the revenue horizon are set out in E.B.O 188 Section 2.2 Specific Parameters.

Exhibit 1, Tab 10, Schedule 5, Attachment 1
2019 Achievable Potential Study, APS (https://www.ieso.ca/2019-conservation-achievable-potential-study)
Federal Clean Building Strategy Discussion Paper:
https://www.nrcan.gc.ca/sites/nrcan/files/engagements/green-building-strategy/CGBS%20Discussion%20Paper%20-%20EN.pdf

Question(s):

The Posterity Group study provided by Enbridge Gas (p. 42, Reference Scenario) includes assumptions related to the Greenhouse Gas Pollution Pricing Act schedule as \$20/tonne CO2e in 2019 rising to \$58.58/tonne C02e in 2023. The study also includes assumptions related to the Natural Gas Commodity Price being 11.75¢/m3 in 2019 rising to 15.90 ¢/m3 by 2038 as well as the DSM Budget of \$132 million being held constant. The Posterity Group Reference Case follows the volume and account forecast provided by Enbridge Gas, which reflects 2019 enforced codes and standards.

a) Please provide rationale for each of the above noted assumptions in the Reference Case, given established DSM budgets for 2023 onwards, regular updates to the building code, significantly higher commodity costs since 2019, and established increases to the federal carbon prices after 2023. If the reference case was not meant to reflect established understanding related to DSM budgets for 2023 onwards, regular updates to the building code, significantly higher commodity costs since 2019, and established increases to the federal carbon prices after 2023 of current reality, please explain why it was included in this study.

b) Please describe how the impacts of existing and announced federal and municipal policy and programs, including promotion of electrification and energy efficiency, such as the Federal Canadian green building strategy, have been considered in the reference case. If they have not been considered, please explain why not.

Response:

The following response was provided by Posterity Group:

a) The objective of the Reference Case scenario was to forecast gas consumption from 2020 to 2038 based on exogenous conditions that follow a ‘business-as-usual’ scenario, that adheres to enshrined laws and regulations (policy environment) and where historical trends continue similarly into the future. The scenario allows comparison of Steady Progress, Diversified Portfolio, Electricity Centric and ETI scenarios to a ‘business-as-usual’ scenario. The various scenarios are meant to capture a range of possible changes to DSM budgets, updates to building code, changes to commodity costs, and changes to the federal carbon price trajectory that could occur in the future.

At the time the Reference Case analysis was completed, it reflected Enbridge Gas’s approved forecast methodology. The ETSA study base year is 2019 and was the most recent complete year of billing data when the modeling was developed. The volume forecast that informed the reference case was also Enbridge Gas’s most current forecast at the time the analysis was completed. Account totals and energy intensities in the base year are adjusted to match the forecasted account and consumption growth provided by Enbridge Gas.

Enbridge Gas’s forecast included assumptions about DSM budget, building codes, commodity costs and carbon prices as outlined in Exhibit 1, Tab 10, Schedule 5, Attachment 1, pages 42 to 45. At the time, these assumptions reflected enshrined laws and regulations as of October 2020, and ‘business-as-usual’ trends. Specifically:

i) Established DSM budgets for 2023 onwards

DSM budget for 2023 onwards had not been established at the time the Reference Case scenario was developed. DSM budgets included in the reference case represent a continuation of current activity (as of 2019).

ii) Regular updates to the building code

The Reference Case volume forecast reflected building codes and standards that were being enforced at the time Enbridge Gas developed the forecast (as of 2019).

iii) Significantly higher commodity costs since 2019

The Reference Case volume forecast reflected the commodity cost forecast estimate that was current when Enbridge Gas developed the forecast (as of 2019).

iv) Established increases to the federal carbon prices after 2023

The Reference Case volume forecast reflected the carbon price forecast estimate that was current when Enbridge Gas developed the forecast (as of 2019). At the time, Canada's Minimum National Carbon Pollution Price Schedule did not extend beyond 2022.

b) Existing enforced policies and programs (current as of 2019) were included in the Reference Case. The Reference Case scenario does not include announced policies or programs that are not enshrined in law or regulation, as they would not be considered 'business-as-usual'. Please refer to part a) for details on the Reference Case scenario.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 1

Question(s):

The Posterity Group study provided by Enbridge Gas (p. 19-20, Price Elasticity) includes an explanation that price elasticity is only used to adjust consumption of natural gas in response to price changes of natural gas and carbon price, but that price elasticity considerations did not influence demand for Renewable Natural Gas (RNG), hydrogen or carbon capture and storage (CCS). Prices of RNG, hydrogen and natural gas with carbon capture were not used as factors that change consumption of these fuels.

a) Please provide rationale for use of elasticity of natural gas demand for each sector based on these historical studies, including one study dating back to 1997, given commodity and carbon costs context being significantly different today.

b) Please explain whether any sensitivity analysis was conducted on these elasticity assumptions. If yes, provide and describe the results. If not, please explain why not and please provide a qualitative explanation of the impact of significantly different elasticity rates than used in this study.

c) Please explain the rationale for not considering consumer price elasticity for RNG, hydrogen, and CCS in any scenario, given that the prices of these options are likely to impact adoption by customers.

Response:

The following response was provided by Posterity Group:

a) The elasticity values used are based on the best research currently available. Should new research be undertaken and published, these values will be updated.

b)
i) Please explain whether any sensitivity analysis was conducted on these elasticity assumptions

We did not conduct such a sensitivity analysis in this work.

ii) If not, please explain why not and please provide a qualitative explanation of the impact of significantly different elasticity rates than used in this study. While a sensitivity analysis on the price elasticity assumptions was not conducted, carbon price and natural gas commodity price did vary depending on the scenario.

Increasing the sensitivity by 10% has exactly the same effect in the Navigator model as increasing the change in energy cost by 10%. Please see response at Exhibit I.1.10-SEC-34 which explains how fuel switching is modelled using "own-price" elasticity assumptions.

For example:

- If we assume a long-run elasticity of -0.2, and the energy price rises by 50%, our modelling approach forecasts consumption will go down by 10%, by the target year
- If the price change increases by 10% of its original value (a 55% increase instead of a 50% increase), our modelling approach forecasts consumption will go down by 11%.
- If instead of increasing the price change from 50% to 55%, the elasticity is adjusted from -0.2 to -0.22, the modelling approach forecasts consumption will go down by 11%.
- The sensitivity analysis for both would be duplicative.

c) We do not have any information suggesting that the consumer price elasticity of demand for these fuels would be different from the elasticity for natural gas. In the scenarios where these fuels play a large role, part of the scenario narrative is that they do so because their cost is attractive relative to other energy options. Because the future costs of these fuels are uncertain, particularly in the scenarios where they play a large part, we did not consider price elasticity in determining how much of them would be included.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 1
2019 Achievable Potential Study, APS (https://www.ieso.ca/2019-conservation-achievable-potential-study)

Question(s):

The Posterity Group study provided by Enbridge Gas includes the following:

- Customer account assumptions for all scenarios (p. 42 of study) in which the Reference Case is calibrated to Enbridge Gas' account forecast which provides growth rates by rate class which are mapped to the sectors in the model as follows: Residential: ~1% annual growth; Commercial: 0.1-0.4% annual growth; and Industrial: decline by 0.7% from 2019-2021 and hold constant from 2022-2038.

- Assumptions around fuel-switching in Electricity-Centric Model (p. 43 of study) as follows: Policy driven fuel switching for Residential/Commercial sectors: New residential and commercials will not connect to the gas grid starting in 2026 and water/space heating in existing buildings will be replaced at equipment turnover rate; space and water heating will be served by Air-source heat pump (ASHP) without gas back-up; and Non-mandated electrification of some industrial end-uses in some sectors as equipment will be replaced.

- In the Electricity Centric scenario (p. 69), annual volume decreases by 22% by 2030 and by 52% by 2038 relative to 2019. Increased electrification of space and water heating, high stringency codes and standards, high carbon pricing, and high DSM spending all lower volumes of gaseous fuels.

a) The 2019 APS found that 62% of natural gas use was in commercial and residential buildings in 2019 (page 12 of 2019 APS). Please explain why the estimated decline in natural gas use is 52% in 2038, given all scenarios anticipate growth in the number of residential and commercial customers, but a declining number of industrial customers.

b) Given heat pumps provide both heating and cooling, was consideration given to replacement of air conditioners with heat pumps, which could also reduce natural gas consumption if those heat pumps are used for heating (i.e. hybrid heating)? If yes, how? If not, why not?

c) Were cold climate heat pumps assumed to be required for all space and water heating? If yes, why? If not, in what circumstances would they be installed?

Response:

The following response was provided by Posterity Group:

a) As stated on Exhibit 1, Tab 10, Schedule 5, Attachment 1, page 69, the 52% decline in the Electricity Centric scenario is caused by the following modeling assumptions: "Increased electrification of space and water heating, high stringency codes and standards, high carbon pricing, and high DSM spending all lower volumes of gaseous fuels." Please see Exhibit 1, Tab 10, Schedule 5, Attachment 1, pages 42-45 for the detailed input assumptions used to model the Electricity Centric scenario. Of these, the critical driver with the most impact is non-price driven fuel switching. The model is configured so that after 2025 new residential and commercial buildings won't connect to the gas grid, and water and space heating equipment in existing buildings will be replaced with electric equipment. In the industrial sector, it is assumed that after 2029 no new gas-fired equipment is permitted for HVAC and Process Heating (Water and Steam), as detailed in the table on Exhibit 1, Tab 10, Schedule 5, Attachment 1, page 114. As existing equipment for these end uses reaches the end of its effective useful life in the existing buildings or plants, 100% of it must be replaced by electric equipment. The effect of these assumptions accounts for the largest part of the 52% reduction.

b) This study was focused on modeling impacts only on Enbridge Gas's system. In scenarios where there was fuel switching away from natural gas to electricity, either non-price-driven or price-driven, no explicit assumption was made about what electric technology would replace the gas appliance. It is reasonable to assume heat pumps would be common replacements for the gas space heating equipment. It is also reasonable to assume that air conditioner owners who install a heat pump will not keep their air conditioners. The effects of that change do not show up in the study results because the study does not report on electricity consumption. We did not consider a situation where building owners would install a heat pump primarily as a replacement for the air conditioner, where the heat supplied is considered a by-product. As we understand the question, the heat pump would be sized for the cooling load and would be undersized for the heating load. The existing gas-fired equipment would be retained to provide heating when the heat pump is insufficient. This hybrid option was not included in the scenario developed under this study.

c) As discussed in response to part b), we made no explicit assumptions about what electric heating equipment would replace the gas appliance in scenarios with gas to electric fuel switching.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 1
OEB Marginal Abatement Cost Curve: https://www.oeb.ca/industry/policy-initiatives-and-consultations/consultation-develop-regulatory-framework-natural-gas, p. 47

Question(s):

The Posterity Group study provided by Enbridge Gas includes the following:

- Customer account assumptions for all scenarios (p. 42 of study) in which the Reference Case is calibrated to Enbridge Gas's account forecast which provides growth rates by rate class which are mapped to the sectors in the model as follows: Residential: ~1% annual growth; Commercial: 0.1-0.4% annual growth; and Industrial: decline by 0.7% from 2019-2021 and hold constant from 2022-2038.
- Assumptions around fuel-switching in Electricity-Centric Model (p. 43 of study) as follows: Policy-driven fuel switching for residential/commercial sectors includes assumptions that these sectors will not connect to the gas grid starting in 2026, and water/space heating in existing buildings will be replaced at the existing equipment turnover rate; Space and water heating will be served by ASHP without gas back-up; and Non-mandated electrification of some industrial end-uses in some sectors as equipment is replaced
- In the Electricity Centric scenario (p. 69), annual volume decreases by 22% by 2030 and by 52% by 2038 relative to 2019. Increased electrification of space and water heating, high stringency codes and standards, high carbon pricing, and high DSM spending all lower volumes of gaseous fuels.
- Information related to RNG, Hydrogen and carbon capture, utilization and sequestration (CCUS) - p. 26, including
    - Renewable Natural Gas: Max: Mandated use of RNG requires about three billion cubic meters per year by 2038, which is 11% of reference case demand in 2038
    - Hydrogen (H2): Max: Hydrogen blending begins in 2025, consumption reaches 12 billion cubic meters per year in 2038, or about 14% of Reference Case demand in 2038, based on mandated hydrogen targets.

- CCUS: Carbon capture is used for all process heating and power generation in refineries, chemicals, nonmetallic minerals, primary metals, and utilities in the former Union South, phased-in between 2028 and 2037
- High: Renewable content policies build demand for RNG and H2; H2 strategy overcomes equipment H2 barriers and carbon capture and sequestration (CCS) deployed for industrial end uses/ sectors not using H2

a) The OEB's Marginal Abatement Cost Curve identified the potential for RNG production in Ontario to be 627 million m3, and in Canada, 2.4 billion m3. Please provide rationale for assuming 3 billion m3 of RNG to be available to meet Ontario natural gas demand by 2038.

b) Please provide rationale for assuming 12 billion m3 of hydrogen to be available to meet Ontario natural gas demand by 2038.

c) Please provide rationale for assuming widespread adoption of hydrogen-fueled space and water heating equipment when it can be assumed that all buildings have access to electricity and would therefore have the choice between hydrogen and electric space and water heating equipment.

d) Please provide rationale for assuming widespread adoption of CCS by 2037 given current level of technical feasibility.

e) For RNG, hydrogen, and CCS assumptions in all scenarios, please explain how uncertainty related to technical feasibility has been accounted for in comparison to decarbonization options that are currently technically feasible (e.g. electric heat pumps, energy efficiency).

Response:

The following response was provided by Posterity Group:

a-e) We view the multi-scenario modeling approach as a way to mitigate the risk of uncertainty around different critical driver assumptions. We advise our utility clients to develop plans that are robust in the face of a range of plausible scenarios, particularly in cases where future policy, prices, and economic variables are uncertain (e.g., availability and cost of low/no carbon fuels and supporting technologies and equipment). This allows utilities to develop plans that are robust in the face of a range of plausible scenarios.

i) Please provide rationale for assuming 3 billion m3 of RNG to be available to meet Ontario natural gas demand by 2038.

The maximum setting of 3 billion m3 of RNG was defined as a possible upper bound for RNG on Enbridge's system. The pace and scale of RNG supply development and availability is assumed as a response to demand creation. This upper bound assumption was provided by Enbridge Gas.

Although Posterity Group did not conduct an analysis of the feasible RNG potential in Ontario, Guidehouse's report (Exhibit 1, Tab 10, Schedule 5, Attachment 2, page 21) cites a Torchlight report that estimates Ontario's RNG potential and we note our upper bound falls within this range:

"Torchlight's report estimated that Ontario has the potential to produce around 40 PJ per year of RNG supply from wet organic wastes and up to around 240 PJ per year if agricultural residues are included."

ii) Please provide rationale for assuming 12 billion m3 of hydrogen to be available to meet Ontario natural gas demand by 2038.

The maximum setting of 12 billion m3 of hydrogen was defined as a possible upper bound for hydrogen on Enbridge Gas's system. The pace and scale of hydrogen supply development and availability is assumed as a response to demand creation. This upper bound assumption was provided by Enbridge Gas.

More detailed assumptions on the hydrogen input settings for the Diversified Portfolio Scenario (the scenario with the highest input assumptions for hydrogen) are presented in Appendix F of the report. Please see Exhibit 1, Tab 10, Schedule 5, Attachment 1, pages 113 to114.

iii) Please provide rationale for assuming widespread adoption of hydrogen-fueled space and water heating equipment when it can be assumed that all buildings have access to electricity and would therefore have the choice between hydrogen and electric space and water heating equipment.

The study has not assigned a probability or a likelihood to the Diversified Portfolio scenario occurring (the scenario with the highest input assumptions for Hydrogen) - rather it is one of several scenarios describing a possible future. Please see Exhibit 1, Tab 10, Schedule 5, Attachment 1, pages 40 to 41 for details on the Diversified Portfolio scenario narrative, and the key policies and exogenous conditions assumed.

The Diversified Portfolio scenario also implicitly assumes:

a) Innovations in electric storage (or some other supply side electric technology or resource) will occur, and this technology would be available to facilitate additional load on the electricity grid resulting from fuel switching.

b) Hydrogen-ready equipment will be available and is installed (when equipment reaches its effective useful life) for industrial end-uses that switch to hydrogen.

c) Some residential and commercial customers install hydrogen-ready equipment (when equipment reaches its effective useful life).

d) CCS technology will be available and will be retrofitted on existing equipment for some industrial end-uses.

e) Low-carbon fuels, and the technology required to upgrade and inject these fuels in the grid, will be available.

iv) Please provide rationale for assuming widespread adoption of CCS by 2037 given current level of technical feasibility.

The maximum setting for carbon capture and storage technology adoption was defined as a possible upper bound for industrial segments and end-uses served by Enbridge Gas's system. The pace and scale of CCS technology development and availability is assumed as a response to demand creation. This upper bound was provided by Enbridge Gas.

More detailed assumptions on the industrial sector CCS input settings for the Diversified Portfolio Scenario (the scenario with the highest input assumptions for CCS) are presented in Appendix F of the report. Please see Exhibit 1, Tab 10, Schedule 5, Attachment 1, page 114.

v) For RNG, hydrogen, and CCS assumptions in all scenarios, please explain how uncertainty related to technical feasibility has been accounted for in comparison to decarbonization options that are currently technically feasible (e.g. electric heat pumps, energy efficiency).

Uncertainty related to technical feasibility was accounted for by developing multiple scenarios. Please see Exhibit 1, Tab 10, Schedule 5, Attachment 1, page 39 for details on the process used to develop the scenario narratives and inputs assumptions for the study. As indicated on this page, the process is founded on the idea that "Scenarios are not about predicting the future, rather they are about perceiving futures in the present. A good scenario asks people to suspend disbelief in its stories long enough to appreciate their impact. The end result is not an accurate picture of tomorrow, but better decisions about the future." To this end, as noted in Exhibit 1, Tab 10, Schedule 5, Attachment 1, page 6, both the Electricity Centric and the Diversified scenarios assume innovation occurs. Innovation with respect to expanding non-emitting power generation and electricity storage capacity, without the benefits of gas back-ups to service peak heating needs (see narrative on Page 40) is assumed in the Electricity Centric scenario. Similarly, the Diversified scenario assumes innovation in RNG, hydrogen and CCS capacity occurs to satisfy demands realized by a renewable gas content policy.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 6, pp. 13-14

Question(s):

Enbridge Gas describes the objectives of its Energy Transition Plan and also describes how it considers an action to be a 'safe bet' action.

Please describe whether and how Enbridge Gas considered the risk of asset stranding in its objectives for its Energy Transition Plan and also describe how Enbridge Gas considered the risk of asset stranding in considering whether an action is a 'safe bet'.

Response:

The risk of asset stranding was considered in Enbridge Gas's Energy Transition Plan (ETP) objectives (Exhibit 1, Tab 10, Schedule 6, p.13), in that Enbridge Gas believes achievement of the objectives will minimize this risk.

In achieving the first ETP objective, "maintaining alignment with Ontario's energy objectives and with provincial and federal energy transition and climate change targets and policies", Enbridge Gas will minimize the risk of asset stranding. Both federal and provincial governments, through policies and discussion papers, show support for a diverse set of actions that rely on the continued use of the gas system. These diverse actions include support for energy efficiency, electrification, low-carbon fuels, and carbon capture, utilization, and sequestration (CCUS) (Exhibit 1, Tab 10, Schedule 6, p. 9).

By achieving the second ETP objective, "providing cost-effective, secure, reliable and resilient energy for customers during the transition to a low-carbon economy and once net-zero is achieved", Enbridge Gas believes its assets will remain of value and, therefore, the risk of asset stranding is minimized. It is for this reason that Enbridge Gas commissioned a study that sought to understand how net-zero goals could impact natural gas demand and what role the gas system could play in Ontario in achieving its GHG reduction targets, please see Exhibit 1, Tab 10, Schedule 5 for the study's details). The Pathways to Net-Zero Emissions for Ontario (P2NZ) Study found that both the Electrification and Diversified scenarios achieve net-zero GHG emissions by 2050, that a diversified scenario achieves significant savings as compared to an electrification scenario and that regardless of the pathway chosen to achieve net-zero, energy efficiency, RNG, hydrogen and natural gas with CCUS are required.

By achieving the third ETP objective, “supporting an orderly energy transition in Ontario”, Enbridge Gas believes that customer choice will be maximized and that no one group of customers will carry the burden of reaching net-zero. Enbridge Gas believes that achievement of this objective will require the use of the Company’s assets and, therefore, achieving this objective will mitigate the risk of asset stranding.

Finally, Enbridge Gas’s definition of a safe bet action was created with the risk of asset stranding at the forefront. It is for that reason that each proposed safe bet action not only fulfills the safe bet definition, but it also does not result in overinvesting in a particular pathway prior to the Ontario government defining its energy transition plans in more detail.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 6, p. 26

Question(s):

CCUS refers to the capture of carbon dioxide (CO2) emissions from facilities or directly from the air, which are then compressed and transported to be permanently stored in geological formations underground or to be used to create products. Enbridge Gas considers CCUS to be a “safe bet” as it is required to significantly reduce Ontario’s GHG emissions. Enbridge Gas says that studies show Ontario’s unique geology is well suited to store carbon. Enbridge Gas is not requesting OEB approval for any costs or activities related to CCUS in the current application. Enbridge Gas is completing studies to further evaluate potential subsurface CO2 storage regions in Ontario.

Will the studies being completed by Enbridge Gas compare the financial benefits for shareholders and ratepayers of CCUS to the financial benefits of conventional natural gas storage? If not, would Enbridge Gas add this comparison to the scope if its studies?

Response:

The studies that Enbridge Gas is currently completing related to CCUS do not compare the financial benefits of CCUS to conventional natural gas storage. The studies are related to the geologic feasibility of CO2 storage in Ontario. Enbridge Gas does not plan to compare the financial benefits of CO2 storage to the financial benefits of natural gas storage.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Association of Power Producers of Ontario (APPrO)

Interrogatory

Reference:

Exhibit 1 Tab 10 Schedule 3

Preamble:

Enbridge Gas is evaluating opportunities that can generate CFR credits which may include CNG vehicles, the voluntary RNG program and hydrogen blending. Enbridge Gas may register as a credit creator to generate, trade and sell credits under the program where participation in the CFR credit market can support the Company and its customers in adopting lower carbon solutions.

Question(s):

a) How will Enbridge use any revenue from CFR credits?

b) Has Enbridge established any oversight or governance documents related to revenue from CFR credits? If so, please provide them.

Response:

a) Where Enbridge Gas is able to prudently obtain or generate CFR credits through its regulated operations, the Company believes that any associated revenues will be to the benefit of ratepayers. The specific mechanism or mechanics of providing that benefit to ratepayers, and or to which group of ratepayers, is yet to be determined and may depend on the activities and types of CFR credits obtained.

b) Enbridge Gas is in the process of developing process and procedures related to CFR credits and does not currently have finalized documents to provide.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Association of Power Producers of Ontario (APPrO)

Interrogatory

Reference:

Exhibit 1 Tab 10 Schedule 6

Preamble:

Enbridge Gas has developed an ETP, including some "safe bet" actions and proposals, to recognize and incorporate, where possible, the current impacts of energy transition and to ensure that progress towards Ontario's 2030 GHG emissions reduction targets and a net-zero future can continue despite the current pathway uncertainty.

The safe bet actions that have shaped Enbridge Gas's ETP are:

a) Maximizing energy efficiency;
b) Increasing the amount of RNG in the gas supply;
c) Reducing GHG emissions from the industrial and transportation sectors via fuel 16 switching and CCUS;
d) Integrating gas and electric system planning; and
e) Supporting consumer choice and the energy transition journey.

Question(s):

a) Has Enbridge ranked the proposed "safe bet" options on the underlying economic viability of each of the options? If so, please provide the ranking?

b) If not, how does Enbridge intend to target the options that provide the most value for ratepayers?

Response:

a) Enbridge Gas has not ranked the safe bet actions as provided at Exhibit 1, Tab 10, Schedule 6.

b) Although Enbridge Gas's vision of energy transition in Ontario is a diversified pathway, as provided at Exhibit 1, Tab 10, Schedule 5, Section 3, the Company has proposed safe bet actions that support energy transition regardless of the path, that will drive near-term emissions reductions and/or will maintain pathway optionality until further clarity exists on which pathway will come to fruition. The pursuit of any one individual safe bet action in isolation from the rest will not support Ontario's progress towards net-zero and, therefore, Enbridge Gas believes that steps must be taken now to enable all of these actions as opposed to ranking and staging them. The future is uncertain and the pathway to net-zero is uncharted, investing in all of the proposed safe bet actions can reduce emissions over the 2024 to 2028 period, while maintaining optionality for serving future energy demands reliably and safely. The maintenance of optionality inherently provides value by preserving consumer choice through the energy transition.

.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Association of Power Producers of Ontario (APPrO)

Interrogatory

Reference:

Exhibit 1 Tab 10 Schedule 7

Preamble:

Enbridge Gas is proposing to create an ETTF in the amount of $5 million annually, for a total of $25 million over the period of 2024 to 2028. This funding is proposed to be collected through a rate rider rather than through base rates, with a new variance account established to record variances between the amounts collected by the ETTF rate rider and actual costs incurred for ETTF initiatives. Details on the proposed regulatory treatment are provided in Section 4.

While Enbridge Gas will continue to leverage this DSM funding to develop innovative energy efficiency technologies and programming, important aspects of energy transition “safe bets” like RNG, hydrogen and CCUS also require significant technology development in the province, thus requiring meaningful funding levels. For example, while initiatives such as blending renewable content into fossil fuels and increasing production of biogas and RNG have started, the full potential of related technologies is yet to be unlocked through technology advancement on a commercial scale.

The rate rider will be a fixed monthly customer charge to be collected from in- franchise customers so that each customer contributes equally to the development of low-carbon energy technologies. The forecast amount to be collected from customers is $5 million per year, totaling $25 million over the 2024 to 2028 period. As a result, the $5 million proposed to be collected for the ETTF is incremental to the proposed 2024 revenue deficiency. Please see Exhibit 8, Tab 1, Schedule 2 for the rate design and recovery proposal of the ETTF.

The monthly bill impact of the ETTF is $0.11 per customer. Enbridge Gas’s recent customer engagement shows that the majority of customers support contributing towards an innovation and technology fund with the goal of advancing low-carbon technologies. Please see Exhibit 1, Tab 6, Schedule 1, Attachment 1, pages 16-17 for a summary of these customer engagement results.

Question(s):

a) Please provide details on how the $5 million in annual revenue will be spent.

b) Please provide details on how the $5 million in annual revenue will not target unregulated activities.

Response:

a-b) This evidence will be addressed in Phase 2 of the proceeding as noted in Enbridge Gas's February 1, 2023 letter.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Building Owners and Managers Association (BOMA)

Interrogatory

Reference:

1-10-4

Preamble:

This section provides details on how Enbridge Gas has considered energy transition in the company's forecasted number of customers, average use, design day and design hour demand, and distribution contract customer demand.

Question(s):

a) Please provide Enbridge Gas' (EGD and Union combined) consolidated history and forecast of annual, design hour and design day gas demand for each year from 2018 until 2028 for the commercial, residential and industrial sectors and the whole system.

b) Please provide EGI's history and current forecast of annual, design hour and design day gas demand savings due to DSM for each year from 2018 until 2028 for the commercial, residential and industrial sectors and the whole system.

c) Please provide EGI's current forecast of annual, design hour and design day gas demand savings arising from the Energy Transition Scenario Analysis for each year from 2024 until 2028 for the commercial, residential and industrial sectors and the whole system.

d) Please file a copy of any studies estimating the potential for annual, design hour and design day gas use reductions due to ventilation heat recovery in commercial buildings conducted by EGI or which EGI is aware of.

e) Please file a copy of any studies estimating the potential for annual, design hour and design day gas use reductions due to modified unoccupied space temperature setback in commercial buildings conducted by EGI or which EGI is aware of.

f) Please file a copy of any studies estimating the potential for annual gas use reductions due to application of heat recovery chillers in commercial buildings conducted by EGI or which EGI is aware of.

g) Please file a copy of any studies or reports on year over year INCREASES in weather normalized gas use in commercial buildings, which are unexplained by known changes in building use, occupancy or operations, conducted by EGI or which EGI is aware of.

h) Please confirm that QRAM fully trues up for all variances between forecast and actual annual gas prices and volumes and that EGI does not benefit in any way financially from such variances.

Response:

a) Please see response at Exhibit I.5.3-STAFF-215 part a), Attachment 1 for the historic and forecast annual demand. Please see response at Exhibit I.1.10-GEC-11 part c) for the design hour demand prior to 2022. The design hour forecast for 2022 to 2028 is shown in response at part b) . The forecasted design day demand is not available for the years prior to 2023, only actuals are available. The total design day demand is shown in response at part b) for 2023 to 2028.

b-c) Table 1 provides the net annual, fully effective m^3 savings from DSM each year from 2018 to 2021 (actual) and forecast 2022 to 2025. Actual annual volumetric forecasts include a combination of partially effective and fully effective volumes. The current DSM Plan expires 2025, per OEB approval; any potential DSM m^3 savings after 2025 are to be determined.

Table 1
(m^3)

Line No.	Sectors (1)	2018	2019	2020	2021	2022 (2)(3)	2023 (3)	2024 (3)	2025 (3)
		(a)	(b)	(c)	(d)	(e)	(f)	(g)	(h)
1	Residential	19,470,732	21,354,836	19,412,509	20,132,845	18,857,170	25,031,392	26,750,005	28,127,670
2	Commercial	33,849,928	34,390,287	20,029,986	24,941,773	28,326,776	26,464,368	27,006,156	27,642,576
3	Industrial	55,235,858	59,945,704	56,796,187	49,783,283	58,712,193	62,560,792	63,792,144	65,067,986
4	Total	108,556,518	115,690,827	96,238,682	94,857,901	105,896,139	114,056,552	117,548,304	120,838,233

Notes:

(1) Sectors are based on QRAM Rate Class Sectors and not DSM sector-based reporting.

(2) 2022 results are not yet finalized. Instead, the m^3 savings at 100% target have been provided.

(3) 2023 to2025 savings are forecast based on 100% target; sectors estimated based on historical data.

Please see response at Exhibit I.1.10-STAFF 31, Attachment 1, Table 1 for the annual volume forecast for 2024 to 2028 and Table 7 for the change in annual volumes in these years due to energy transition assumptions.

The individual effects of DSM and energy transition cannot be separated for design day or design hour demand. As provided at Exhibit 4, Tab 2, Schedule 3, paragraph 51, g) ii), the design day demand accounts for a declining trend in general service use per customer, reflecting observed energy efficiency gains or processes or behavioural changes. As provided at Exhibit 1, Tab 10, Schedule 4, paragraph 29, the incorporation of design hour adjustment factors based on the ETSA reference case allowed for impacts of DSM to be accounted for along with other energy transition related impacts.

The design day demand forecast with and without energy transition assumptions applied, and the resulting delta in demand for 2023 to 2028 is shown in Table 2. Design day demand is segregated into general service and contract demand. The general service portion cannot be broken out by sector.

The design hour demand forecast with and without energy transition assumptions applied, and the resulting delta in demand for 2022 to 2028 is shown in Table 3. The design hour demand cannot be broken out by sector as the input sectoral segregation was not preserved when aggregated into a single number.

Table 2
Total Design Day Demand with and without Energy Transition Assumptions

	Before Energy Transition Assumptions			After Energy Transition Assumptions			Difference		
m3/day	General Service	Contract Rate	Total	General Service	Contract Rate	Total	General Service	Contract Rate	Total
	(a)	(b)	(c)	(d)	(e)	(f)	(g)	(h)	(i)
2023	154,314,452	74,130,269	228,444,721	153,507,137	74,130,269	227,637,406	(807,315)	-	(807,315)
2024	155,799,642	75,379,580	231,179,223	154,250,038	75,379,580	229,629,618	(1,549,605)	-	(1,549,605)
2025	157,196,692	77,463,080	234,659,772	154,977,790	77,463,080	232,440,871	(2,218,902)	-	(2,218,902)
2026	158,566,103	81,066,960	239,633,063	155,740,767	81,066,960	236,807,727	(2,825,336)	-	(2,825,336)
2027	159,880,699	71,298,473	231,179,172	156,514,859	71,298,473	227,813,332	(3,365,840)	-	(3,365,840)
2028	161,120,779	82,290,960	243,411,739	157,272,665	82,290,960	239,563,625	(3,848,114)	-	(3,848,114)

Table 3
Total Design Hour Demand with and without Energy Transition Assumptions

m3/hr	Before Energy Transition Assumptions	Energy Transition Assumptions in Customer Count And Demand per Customer	Difference
	(a)	(b)	(c)
2022	11,081,827	11,030,547	(51,280)
2023	11,149,588	11,032,940	(116,648)
2024	11,214,430	11,066,640	(147,790)
2025	11,279,508	11,087,961	(191,547)
2026	11,341,141	11,121,255	(219,887)
2027	11,399,188	11,148,362	(250,826)
2028	11,453,584	11,183,727	(269,856)

d) The 2019 Integrated Ontario Electricity and Natural Gas Achievable Potential Study led by the IESO and the OEB included heat recovery ventilation among the measures it studied for annual electric and gas savings potential in commercial buildings.[1]

e) The 2019 Integrated Ontario Electricity and Natural Gas Achievable Potential Study led by the IESO and the OEB included adaptive thermostats among the measures it studied for annual electric and gas savings potential in commercial buildings.[2] Please see ICF Canada's Final Report on Natural Gas Integrated Resource Planning: Initial Assessment of the Potential to Employ Targeted DSM to Influence Future Natural Gas Infrastructure Investment, dated May 18, 2018, pages ES-21 to ES-22 and page 89 to 90, filed in response to procedural order No. 2 issued by the OEB for EB-2020-0091.

f) None.

g) None.

h) Confirmed. All gas supply commodity, transportation, load balancing, and inventory revaluation costs are passed through to customers without markup and Enbridge Gas does not benefit financially from any such variances between forecast and actual costs. Please see Exhibit 9, Tab 1, Schedule 2, Section 1 for the costs that are proposed to be cleared through the QRAM and the relevant deferral and variance accounts. Enbridge Gas is proposing to record variances related to gas

---

[1] 2019 Integrated Ontario Electricity and Natural Gas Achievable Potential Study, December 10, 2019, p.E-20, https://www.oeb.ca/sites/default/files/2019_Achievable_Potential_Study_20191218.pdf
[2] Ibid, p. 181.

supply commodity and gas supply-related transportation costs for sales service customers in the PGVA and separate variance accounts will record variances related to upstream transportation, load balancing, and inventory revaluation.

Answer to Interrogatory from
Building Owners and Managers Association (BOMA)

Interrogatory

Reference:

1.10.7

Question(s):

Energy Transition Technology Fund: Please describe the proposed governance and decisionmaking process for identifying, qualifying and prioritizing potential projects and expenditures.

Response:

The evidence on Energy Transition Technology Fund (ETTF) will be addressed in Phase 2 of the proceeding as noted in Enbridge Gas's February 1, 2023 letter.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Building Owners and Managers Association (BOMA)

Interrogatory

Reference:

1.10.2 page 4

Preamble:

Enbridge Gas's system consistently fulfills these critical energy system needs because of its:

c) System storage capacity, via underground storage facilities and via 'linepack'10 in the gas transmission system.

Question(s):

a) Please provide EGI's total gas storage capacity in terms of volume Mm3 and days of supply under design day conditions.

b) Please describe how much of this capacity is allocated/available to the commercial buildings sector.

Response:

a) The total capacity of Enbridge Gas's storage system is 8,046,000 10^3m^3 (314 PJ). This includes 199.4 PJ of cost-based storage for the utility and 117.6 PJ for the non-utility storage. Enbridge Gas can deliver 6.6 PJ from the storage system on design day. The storage system is designed to be able to deliver the design day flow on any day prior to March 1. Theoretically, this would mean that Enbridge Gas could operate for 35 consecutive days at 6.6 PJ.

b) Enbridge Gas is unable to identify storage requirements specifically for the commercial buildings sector as storage capacity is not allocated to specific sectors or customer types.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 1/T10/p. 1

Question(s):

Please specifically set out how energy transition issues have impacted the 2024 revenue requirement and deficiency. What financial impact will energy transition issues have on EGI's rates for the 5-year period beginning in 2024?

Response:

Of the energy transition safe bets issues from Exhibit 1, Tab 10, Schedule 6, Table 1: Summary of Energy Transition Related Rebasing Proposals, page 15 to 18, there are 4 Enbridge Gas initiatives with rebasing proposals; Voluntary RNG Program/Low-Carbon Voluntary Program (LCVP), Natural Gas Vehicle (NGV) Program, Hydrogen Blending Grid Study (HBGS) and the Energy Transition Technology Fund (ETTF). Impacts for the Low Carbon Energy Project (LCEP) Phase 2 were also considered in the calculation, although there was no proposal put forward in Rebasing. Enbridge Gas intends to pursue approval through a leave to construct application.

The impact of these energy transition issues on the 2024 revenue requirement and deficiency is $1.17 million and $0.65 million respectively. The calculation is shown in Table 1.

Table 1
2024 Energy Transition Impacts on Revenue Requirement and Deficiency

($ millions)	2024
Revenue Requirement for capital investments in LCVP, NGV, HBGS, and LCEP	1.32
Recovery of O&M for NGV Program	0.50
Total Revenue Requirement (a)	1.82
Reduction of General service annual volume forecast (approx.. 1,062,274 m^3 for 2024)	-0.10
Revenue forecasted from NGV rental station	1.27
Energy Transition Proposals Impact on Revenue (b)	1.17
Impact to Deficiency (a) minus (b)	**0.65**
ETTF	5.00
Total Impact	**5.65**

The impact to Enbridge Gas's rates of reflecting energy transition issues in the Application is an annual bill increase of $1.49 in 2024 and increases by $0.03 to $1.52 in 2028 for a typical residential customer.

The deficiency impact in 2024 was escalated in future years to estimate bill impacts for 2025 to 2028. The annual bill impact of the ETTF was not escalated. Escalation assumptions include GDP IPI FDD of 2%, productivity of -1.35% and stretch of 0% for an overall PCI of 3.35% per year. No rate rider impacts were assumed for the Voluntary RNG Program, which is proposed to begin in 2025 because the impact, if any, would depend on the uptake of the program.

Ex. 1/T10/S2/pp. 15-26

Question(s):

EGI has provided a detailed overview of the Ontario electricity sector. Is the reason why this evidence was produced is to support the statement that, "The IESO's planning activities clearly demonstrate that the gas system, despite longer-term energy transition pathway uncertainty, is needed over the time period covered by this Application."?

Response:

The overview of the Ontario electricity sector provided at Exhibit 1, Tab 10, Schedule 2, pages 15-26 was prepared in order to demonstrate the capabilities of Ontario's electricity sector during the 2024 to 2028 period. This overview was included in evidence because it was part of the data and insights considered in the development of Enbridge Gas's vision of energy transition in Ontario. Please see Exhibit 1, Tab 10, Schedule 5 pages 20-24.

Ex. 1/T10/S3/p. 7

Question(s):

“In October 2021, the federal government announced Canada’s commitment to develop a plan to further reduce methane emissions, setting a target of reducing methane emissions by at least 75% below 2012 levels by 2030. In March 2022, the government released a discussion paper and began consulting with the provinces, industry and other stakeholders on how to achieve the increased ambition. Enbridge Inc. submitted a response to the discussion paper.” Please provide a copy of Enbridge Inc.’s response. Please provide the draft regulations when they become available.

Response:

Please see Attachment 1 for Enbridge Inc’s submission in response to the federal discussion paper. Draft regulations have not been published at this time.

Written Submission on Reducing Methane Emissions from Canada's Oil and Gas Sector

Submitted by Enbridge

May 25, 2022

About Enbridge

Enbridge Inc. is a leading North American energy infrastructure company. We safely and reliably deliver the energy people need and want to fuel quality of life. Our core businesses include Liquids Pipelines, which transports approximately 30 percent of the crude oil produced in North America; Gas Transmission and Midstream, which transports approximately 20 percent of the natural gas consumed in the U.S.; Gas Distribution and Storage, which serves approximately 3.9 million retail customers in Ontario and Quebec; and Renewable Power Generation, which owns approximately 1,766 MW (net) in renewable power generation capacity in North America and Europe.

Enbridge believes that climate change requires serious solutions, and that Enbridge can be part of those solutions. Across our business, we've committed to net-zero greenhouse (GHG) emissions by 2050 and to reduce our emissions intensity 35 per cent by 2030. To drive results and accountability, incentive compensation is tied to meeting these commitments.

Introduction

Enbridge is pleased to provide these comments in response to the Discussion Paper on Reducing Methane Emissions from Canada's Oil and Gas Sector prepared by Environment and Climate Change Canada (ECCC) in March 2022.

The majority of Enbridge's methane emissions are from our natural gas transmission, storage, and distribution business units. In 2020, the total volume of methane released from our North American operations was approximately 1.5 million tonnes of carbon dioxide equivalent (tCO2e), which is approximately 2% less than it was in 2019. Enbridge is committed to taking proactive steps to reduce methane emissions as we work to address our own operational emissions to further realize the environmental benefits of natural gas and its role in the energy transition. Where possible, we use multiple approaches at our facilities to reduce methane emissions. This includes the use of a range of methods to detect methane emissions including:

- Optical gas imaging cameras to detect small leaks of fugitive emissions
- Hand-held 'sniffer' gas detectors
- Air patrols on transmission pipelines to enable repair or replacement of faulty equipment

In addition, we are collaborating with our peers through joint industry partnerships on initiatives aimed at innovation and promoting energy efficiency solutions across the natural gas value chain. We also support advocacy that advances smart, cost-efficient regulations that complement voluntary reduction efforts.

ECCC has proposed an alternative approach to regulating methane that would place a greater emphasis on performance-based objectives to achieve at least a 75% reduction in methane emissions from the oil and gas sector from 2012 levels by 2030. Enbridge understands this approach is due in part to methane emissions being historically underreported from the oil and gas sector, and consideration for a way for these regulations to increase monitoring and reporting to better inform decision making. Enbridge appreciates that this approach would provide more flexibility for innovation for specifying the outcome required while leaving compliance solutions to regulated parties. We also understand that a key factor that will influence the design of the regulations is the availability of enhanced monitoring equipment and the ability to set monitoring, measurement and reporting methodologies for some or all of the methane sources to be covered. Enbridge would likely be required to invest capital and operational expenses to upgrade its current monitoring systems and personnel to manage and report data to align with the proposed performance-based approach. As a rate-regulated entity these expenses would likely be passed along to our shipper customers and therefore Enbridge requests that we be invited to the government-led structured sessions to ensure that cost-effective and efficient approaches are taken to the design and implementation of the alternative approach.

Annex I: Discussion Questions

Context

1. What opportunities exist for regulatory cooperation and alignment, domestically and abroad?

   Enbridge recommends that ECCC engage with the United States (U.S.) Environmental Protection Agency (EPA) to identify opportunities for alignment on regulatory approach. A large portion of Enbridge's natural gas transmission and midstream assets are situated in the U.S. and a more consistent approach would create administrative and operational efficiencies.

   Enbridge also recommends that ECCC continue to engage with industry associations, including the Canadian Gas Association (CGA), to collaborate on development of methodologies to enhance the accuracy of measurement and verification and identify opportunities for continuous improvement. Industry has a vast amount of information available to assist ECCC in the development of a performance-based regulation.

2. What lessons from Federal and Provincial regulatory development and Equivalency experiences should be considered?

   The federal government should acknowledge that jurisdictional differences exist between provinces which created the impetus for provincial Equivalency Agreements in the first place. Applying a one-size-fits-all approach to the regulation of methane may not consider logistical and geographic considerations applicable to certain jurisdictions. For example, requiring physical leak-detection and repair of all above-ground natural gas transmission infrastructure may prove challenging due to the remoteness of certain facilities. Therefore, a regional approach which includes the use of aerial monitoring equipment (such as a drone or fixed-wing aircraft) may enable more frequent and accurate measurements versus 'on-the-ground' assessments.

   ECCC should also acknowledge the significant amount of time which was required to establish Equivalency Agreements between the federal and provincial governments, and therefore either build off the existing Agreements or begin negotiations much sooner to promote policy certainty with industry for investing decision making.

3. What best practices or lessons from international jurisdictions should be considered?

   It's important to understand the individual nature of the regulatory frameworks in international jurisdictions and not rush to pick specific items. Many of these international jurisdictions are looking to Canada for inspiration, as we already have some of the most comprehensive and relatively mature approaches to handling methane emissions. Some examples are outlined below:
   - To our knowledge, Canada is the only jurisdiction to have compressor venting limits.
   - Some jurisdictions are focusing on wet seals emissions limits and conversions, whereas the Canadian operators over the past several decades already have shifted to dry gas seals, where

operationally feasible.

- The proposed EU methane regulations exempt transmission and distribution flaring through the definition of routine flaring. Flaring is used in the transmission and distribution sector to reduce emissions from maintenance and operational activities. Restricting flaring in transmission and distribution could inadvertently increase methane emissions.

Regulatory design to achieve at least a 75% reduction by 2030

4. Should Canada retain the approach in its current oil and gas methane regulations, and expand their coverage and increase their stringency?

   Enbridge's natural gas transmission and midstream operations have historically been regulated by a combination of Federal and/or Provincial Equivalency Agreements in British Columbia, Alberta and Saskatchewan, and the federal Methane Regulation in Ontario. The simplest approach, in our estimation, is to continue with the current regulatory framework and then expand the coverage and stringency of the federal, and Provincially Equivalent regulations.

5. Should Canada develop new, performance-based regulations?

   In developing a new, performance-based regulation the Canadian government may want to consider reviewing the proposed framework within the U.S. Methane Emissions Reduction Act of 2021. The proposed Act included an 'opt out' alternative fee calculation method for companies who wished to demonstrate that their emissions intensity was less than the average for the basin in which they operated. In Canada, a similar optional performance-based system could be applied where compliance is measured relative to a methane-based intensity metric tied to throughput (for the transmission segment). A market-based mechanism, similar to the federal Output-Based Pricing System (OBPS), could then be utilized to incentivize enhanced performance based on the lowest-cost mitigation options to address competitiveness and avoid carbon leakage. The key challenge would be avoiding the duplication of regulatory systems which reduce GHG emissions (i.e., overlap between the federal OBPS and a methane performance standard), specifically methane. Enbridge recommends a hybrid approach to allow for flexibility of compliance options (i.e., current approach versus performance-based approach) given the wide range of facilities and operations that may be covered by a new regulation.

   Additionally, as pipelines are operated as systems and not on an individual facility level it makes sense for any performance-based approach to target the pipeline system level.

6. Are there some sources of methane emissions that are not well suited to a performance-based requirement?

   Methane emissions resulting from an Emergency Shutdown (ESD) may not be well suited to a performance-based requirement. ESDs are typically unplanned and due to the high-pressure of natural gas released and the need for a rapid evacuation of internal piping infrastructure the capture of methane is not feasible. One or more ESD's in a given year may negate the performance benefits of mitigative improvements at the facility to no-fault of the owner. Given the lack of options to mitigate methane emissions from an ESD it is not well suited to be covered within a performance-based approach.

   The application of a performance-based regulation would not be appropriate to local distribution systems given that the emissions reported occur across innumerable intermittent, low volume and diffuse sources. There may be limited opportunity to reduce methane emissions beyond company efforts to date and the application of LDAR provisions to distribution systems is not practical and cost prohibitive.

7. What monitoring and reporting requirements should support performance-based requirements?

   Enbridge recommends the deployment of a dedicated methane Conservation Program which would clearly identify the approach and accountabilities related to the monitoring and reduction of methane emissions. The program would establish the requirements for the incorporation of practical mitigative measures to conserve methane within natural gas-related infrastructure. Performance-related reporting would occur via a periodic review of Conservation Program related to regulatory objectives and the GHG emissions verification process providing assurance to data quality.

8. What barriers exist related to methane monitoring? How can they be overcome?

   Infrared (IR) imaging relies on temperature variances to identify and accurately quantify emissions. Detection via IR technologies is effective when ambient temperatures are cooler than the commodity's temperature. During the warm summer months, monitoring/detection is not as effective or efficient. One way of overcoming this barrier is through increased metering (measurement) of the commodity as it moves through the system (i.e., mass balance equation).

   Current methane monitoring methods are labour intensive and expensive to conduct. As well, since natural gas infrastructure can cover large geographical regions, there is often much travel involved. Allowing alternative measurement methodologies such as airborne or satellite methane detection methodologies should be considered as part of the methane regulations.

9. How can real-time measurement technologies be incorporated into the regulations?

   Real time measurement is key to providing data quality assurance but will require the procurement and installation of new monitoring equipment and associated facility upgrades which can be cost prohibitive for many sites. Regulations which establish a minimum standard for the level of detection for methane will set a level playing field across the industry. Real-time measurement technologies are critical to enabling a performance-based regulation based on a metric tied to production (i.e., throughput volumes). This approach will also enable a demonstration of the benefits of Leak Detection and Repair (LDAR) such that compliance penalties can be minimized through quick action to eliminate leaks and subsequent methane emissions.

10. Should the regulations allow a facility to select which regime to be subject to?

    Yes, to enhance compliance flexibility the regulations should enable the facility owner to select which regime to be subject to. This would address competitiveness issues and enable the low-cost approach to methane mitigation to be employed appropriate to the facility. However, in developing the flexible approach the definition of a 'facility' with respect to a linear facility like a pipeline system would need to remain somewhat fixed to minimize administrative burden for reporting, etc.

11. Should it allow this for different methane sources or only on a facility-wide basis?

    As referenced above, some sources of methane emissions are not suitable to be regulated by a performance-based approach and may be more appropriate to be regulated on an absolute basis. Enhanced compliance flexibility will enable the highest volume of methane emissions to be reduced at the lowest cost.

12. How should methane be treated in other oil and gas policies?
    a. Carbon pricing
        i. Methane emissions are not well suited to be regulated through carbon pricing as many sources cannot be measured or quantified accurately enough. However, the carbon price applied in a performance-based approach can be tied to the federal carbon price on a carbon dioxide equivalence basis (i.e., consideration of global warming potential of methane).
    b. The oil and gas sector emissions cap (in development)
        i. The oil and gas sector emissions cap of 42% below 2019 levels by 2030 should integrate the achievement of Canada's target to reduce methane emissions by 75% from 2012 levels by 2030. Methane regulations should be complimentary to the achievement of the sector emissions cap without unnecessary duplication. The absolute, or performance-based, methane regulation should constitute the 'workhorse' of reducing methane emissions to avoid regulatory duplication and contributing to competitiveness and carbon leakage issues.

Net zero by 2050

13. From the perspective of achieving net-zero GHG emissions by 2050, should any reductions for methane emissions be considered "dead ends" and avoided in the regulations?

    It is our view that local distribution systems should not be regulated. Overlapping LDAR surveys would generate more confusion/risks without substantial difference in emissions. Leak detection is the easy part; repairs are complicated and must be planned carefully to ensure safety of the workers and communities as well as an uninterrupted supply of energy to the consumers. There are diminishing returns from increasing LDAR frequency. There will inevitably be some amount of leakage that will occur, as safety features are included in facilities to avoid overpressure situations resulting in occasional but necessary methane emissions . We can endeavour to reduce as much as possible, but these emissions will likely need to be offset in a net-zero future.

Supportive measures

14. What activities should the science and research community prioritize to support methane reduction?

    The science and research community should prioritize the use of remote sensing technologies to reduce the cost of and improve the quality of measuring methane emissions. The technology would be particularly useful in measuring methane emissions, if any, from remote valve stations (in lieu of a hands-on approach) or other infrastructure.

15. What measures would accelerate deployment of methane reduction technology?

    Economic incentives provided by the generation (and monetization) of carbon offset credits achieved through reductions in methane which are beyond compliance could incentivize investment in innovative methane reduction technologies. For example, the generation of Technology Innovation and Emissions Reduction

(TIER) credits in Alberta through the replacement of pneumatic valves has contributed to a large volume of avoided methane emission reductions which has enabled the practice to 'come to scale' and become more economic.

Conceptually, these carbon offset credits could be used as a compliance pathway in a performance-based regulation for methane. Similarly, revenue generated by a performance-based methane regulation could be recycled into grants for research, development, and investment in emerging methane reduction technology to accelerate deployment more broadly.

16. What limits the deployment of methane reduction technology?

    Deployment of methane reduction technology is limited primarily by the absence of more stringent regulatory requirements to reduce and/or eliminate methane emissions. In addition, the cost of capturing methane from venting and flaring remains somewhat cost-prohibitive and large-scale deployment will require improved economics. More cost-effective real-time measurement of methane emissions will enable enhanced LDAR and subsequent reduction/avoidance of fugitive emission sources.

17. How should a centre for excellence on methane detection and elimination be leveraged to support strengthened methane regulations?

    A Centre for Excellence of methane detection and elimination could be financially supported through the revenue generated by a performance-based methane regulation. The Centre could focus on improving real-time measurement devices and the advancement of technologies to capture methane emissions at various natural-gas related facilities, including sharing best practices across industry.

Conclusion

Thank you for this opportunity to provide input on Reducing Methane Emissions from Canada's Oil and Gas Sector. If you have any questions, please do not hesitate to contact amanda.affonso@enbridge.com

Ex. 1/T10/S4/p. 8

Question(s):

"As a result of the energy transition adjustment to the customer forecast, the 2024 Test Year general service annual volume forecast is approximately 2,899,408 cubic meters per year lower that would otherwise be the case." What is the impact of this reduction on the revenue deficiency?

Response:

The energy transition assumptions impact on the 2024 Test Year general service volume that was provided at Exhibit 1, Tab 10, Schedule 4, page 8 is incorrect. The volumetric impact of 321 fewer customer additions is 1,062,274 m^3. Please see response at Exhibit I.1.10-STAFF-31, Table 7 for a detailed calculation. Regarding the impact of this on the revenue deficiency please see response at Exhibit I.1.10-CCC-28.

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 4, p. 7 of 20, Figure 1

Question(s):

At Figure 1, EGI models its forecast on customer additions through the 2023-2032 period before and after accounting for energy transition assumptions.

a) The Canadian government has recently indicated a desire to significantly increase immigration to Canada with a target of 500,000 by 2025.[1] According to the Government of Ontario, Ontario often receives between 40% and 50% of all immigrants that come to Canada.[2] Does the announcement of an increase in immigration targets impact EGI's forecasting of customer additions through the plan period? Please explain fully.

Response:

a) Enbridge Gas relies on its Consensus Housing Starts forecast to develop its new construction customer additions forecast. Please see response at Exhibit I.3.2-SEC-154 for the sources of the Consensus Housing Starts forecast. The Canadian Government's immigration targets are not a direct input into Enbridge Gas' customer additions forecasting process. The Company cannot comment on the specific methodologies underpinning the individual forecasts that form the Consensus Housing Starts forecast, but to the extent that immigration targets and other assumptions have been incorporated through the Consensus Housing Starts forecast, the Company's customer additions forecast will reflect those assumptions.

[1] See the following Bloomberg article for additional information https://www.bloomberg.com/news/articles/2023-01-03/immigration-to-canada-hits-record-as-trudeau-seeks-more-workers?leadSource=uverify%20wall

ENBRIDGE GAS INC.

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 6, p. 16 of 40

Question(s):

At page 16, EGI explains its proposal with respect to the “Low Carbon Voluntary Program” (LCVP). EGI stated that the program would have EGI procure between 1-4% of its planned gas supply commodity purchases as low-carbon energy. This program would then be offered to large volume sales service customers to purchase to be made part of their gas supply. EGI then states any costs not recovered through the program would be included in the general cost of gas supply commodity purchases.

a) Please confirm that to the extent the costs are not absorbed by the LCVP, the costs will be apportioned to ratepayers on a non-voluntary basis.

b) Has EGI forecasted the voluntary uptake of low carbon energy amongst large volume sales service customers, and how much of the cost of the procurement of low-carbon energy would therefore be voluntarily borne by those customers?

c) If the answer to (b) is yes, please provide EGI’s forecast of the volume and costs that it forecasts will be absorbed by the LCVP program, and the costs that it expects will be borne by non-participants.

d) As CME understands it, the uptake for the Voluntary Renewable Natural Gas program was lower than anticipated. However, there are still a number of participants currently. Has EGI considered whether or not it could offer to apportion any leftover low-carbon energy to voluntary participants who are not large volume sales service customers before apportioning those costs in the general cost of gas supply commodity purchases?

e) If the answer to (d) is yes, please explain why EGI is not proposing to apportion costs amongst additional voluntary participants first.

f) If the answer to (d) is no, please provide EGI’s position on that type of program structure.

Response:

a-f) This issue will be addressed in Phase 2 of the proceeding in accordance with the OEB's Decision on Issues List dated January 27, 2023.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 2, Page 2

Preamble:

“On a peak basis, the natural gas system provides three to five times as much energy as the electricity system. For example, the most recent winter peak (highest hourly flow measured during the winter) occurred at 9 am on January 22, 2022 and was 8,507 103m3/hr or approximately 92 GW. In comparison, the amount of electricity generated in Ontario at the same time was approximately 21 GW, and of this around 20 GW was to serve demand within the province. The amount of electricity generated was close to 70% of the 30.2 GW effective winter capacity.”

Question(s):

a) Please provide the temperature at 9 am on January 22, 2022 (i) in Toronto, and (ii) as an average for Enbridge customers that is population-weighted (i.e. reflecting the fact that most customers are in Southern Ontario). An approximation may be used for the population-weighting. Please provide the calculations.

b) Please provide the temperature, date, time, and GW Ontario electricity demand at the coincident winter peak hour on the electricity system in Ontario in the winter of 2021-2022.

c) Please provide the approximate co-efficient of performance (“COP”) of 3-ton centrally ducted Mitsubishi-Zuba system and Moovair Central system at the temperatures in the answers to (a) and (b). Please indicate the tool or method used to estimate the COP and indicate if the tools found at neep.org would generate a different result, and if yes, please explain. If necessary, please contact the manufacturers to access the information.

d) What temperature does the IESO use to model electricity demand from heating at the time of the coincident electricity system peak for the purposes of determining the electricity resource adequacy.

Response:

a) Enbridge Gas notes that there is an error in the evidence at Exhibit 1, Tab 10, Schedule 2, page 2. The date on which the most recent winter peak (highest hourly flow measured during the winter) occurred was January 20, 2022, not January 22, 2022, as shown.

The temperature in Toronto at 9am on January 20, 2022, was -16.8°C[1] as reported at the weather station at the Toronto International Airport. Please see Exhibit 4, Tab, 2, Schedule 3, page, 18, for the design temperatures used by the Company for Ontario. Due to the variability in temperature across the province a single temperature for Ontario is not possible to provide nor would a population weighted average be appropriate.

b) The highest demand on the electricity system for the winter of 2021-2022 (assumed to be December 1, 2021, to March 31, 2022) occurred on January 20, 2022, for the hour ending at 18:00 (6:00 pm). The demand was 21,349 MW.[2,3] The temperature for Ontario at this time cannot be provided as there is no single temperature for all of Ontario, however the temperature in Toronto at this time was -14.0°C as reported at the weather station at the Toronto International Airport.[4]

c) Please refer to the manufacturers' websites for the approximate COPs for the referenced product lines. Due to the varied combinations of units for a given heating system, it would take considerable time to estimate the approximate COP for the product lines noted, with uncertainty in the estimates. Enbridge Gas is declining to

contact the manufacturers or complete the significant work required to complete this request.

d) Enbridge Gas is not aware of the temperature the IESO uses to model electricity demand from heating.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 2, Page 13

Preamble:

"Ontario's natural gas system provides reliable, resilient, and secure energy in a cost-effective manner. According to the OEB's 2020 Yearbook of Natural Gas Distributors, Ontario's natural gas distributors received $5.1 billion in total revenue for services related to natural gas supply, transport and distribution in 2019. During the same period, the 2020 Yearbook of Electricity Distributors lists power and distribution revenues of $21.7B for Ontario's electricity distributors. Even if the differential between these revenues is adjusted for energy payments to other parties (natural gas marketers who provide natural gas supply to large users, for example), the conclusion that natural gas is very cost effective is inescapable, given that natural gas energy accounted for 30% of total energy demand of Ontario while electricity accounted for 16% of total energy demand in 2019, as shown in Figure 1."

Question(s):

a) The above passage states: "[e]ven if the differential between these revenues is adjusted for energy payments to other parties…" Please calculate the adjustment and provide the adjusted differential. Please include the calculations.

b) Please provide the ratio of T&D costs to commodity costs in Ontario for (i) gas and (ii) electricity.

c) Please provide an estimate of the total costs incurred by Ontario customers in 2020 including commodity (incl. upstream transportation), transmission, distribution, and carbon costs. For volumes of gas not purchased from Enbridge, please either use Enbridge's best estimate of the price paid for the gas or provide the average gas cost for the gas that Enbridge sells to its own customers.

d) Please provide an estimate of the total electricity costs incurred by Ontario customers in 2020 including commodity, transmission, distribution, and carbon costs.

e) Please provide the figures calculated in (c), (d), for the latest year possible (i.e. 2022 if possible).

f) If the figures cannot be calculated for 2022, please recalculate the figure in (c) with the commodity costs increased by the percentage difference in the average commodity costs for 2020 versus 2022.

g) Please recalculate the figure in (c) as if the 2030 carbon prices applied.

<u>Response:</u>

a) Please see Exhibit 1, Tab 10, Schedule 2, page 14, footnote 40.

b)
   i. Using the 2020 estimate gas costs provided in Table 1 for part c), the ratio of T&D costs to commodity costs for gas is 1.18.

   ii. Enbridge Gas does not have the information requested and declines to estimate it. There are more than 50 electricity distributors and transmitters in Ontario; therefore, it would take a significant amount of time and effort to review their respective rate cases for the T&D costs.

c) Please see Table 1 for an estimate of gas costs incurred by Ontario customers in 2020.

Table 1: Total Estimated Gas Costs Incurred by Ontario Customers in 2020

Line No.	Particulars ($millions)	2020
1	Annual estimated commodity costs (1)	2,488.7
2	Annual transportation costs (2)	428.0
3	Annual distribution costs	2,314.8
4	Annual carbon costs (3)	809.1
5	Annual other gas related costs (4))	176.5
6	Total estimated gas costs incurred by Ontario customers	6,217.0

Notes

(1) Estimated commodity cost for customers who do not purchase gas from Enbridge is calculated using the weighted average commodity prices that Enbridge system sales customers paid

(2) Estimated transportation cost for customers who do not purchase gas from Enbridge is not available. Please see response at Exhibit I.1.10-ED-5, part c.

(3) Carbon costs billed to non-exempt Enbridge Gas customers are included but carbon costs associated with exempt entities registered in the Federal Output-Based Pricing System (OBPS) are not included. An OBPS entity’s carbon compliance costs are strictly between them and the federal government and therefore not publicly available.

(4) Other costs include load balancing & storage costs

d) Enbridge Gas notes that there is an error in the evidence at Exhibit 1, Tab 10, Schedule 2, page 13. The power and distribution revenues noted for 2019 from the 2020 OEB yearbook for Electricity Distributors is $17.8B not $21.7B as shown.

Please see Table 2 for an estimate of the total electricity costs incurred by Ontarians in 2020.

Table 2: Total Estimated Electricity Costs Incurred by Ontario Customers in 2020

Line No.	Particulars ($millions)	2020
1	Annual estimated distribution revenue (1)	3,898
2	Annual estimated cost of power (1)	16,090
3	Annual estimated transmission revenue (2)	1,685
4	Annual carbon costs (3)	N/A
5	Annual estimated government subsidies (4)	4,800
6	Total estimated electricity costs incurred by Ontario customers	26,473

Notes

(1)	2020 OEB yearbook for Electricity Distributors
(2)	EB-2019-0296 Decision and Order
(3)	Power producers are typically registered in the Federal Output-Based Pricing System (OBPS) and are therefore identified as exempt entities in Enbridge Gas's systems. Since an OBPS entity's carbon compliance costs are strictly between them and the federal government, and not publicly available, Enbridge Gas is unable to provide an estimate of the carbon costs.
(4)	https://www.fao-on.org/en/Blog/publications/energy-and-electricity-2022

e) Please see Table 3 for an estimate of gas costs incurred by Ontario customers in 2022. Please see Table 4 for an estimate of the electricity cost incurred by Ontario customers in 2021. An estimate for 2022 is not able to be provided as the OEB yearbook for Electricity Distributors hasn't been released.

Table 3: Total Estimated Gas Costs Incurred by Ontario customers in 2022

Line No.	Particulars ($millions)	2022
1	Annual estimated commodity costs (1)	5,972.7
2	Annual transportation costs (2)	426.6
3	Annual distribution costs	2,572.3
4	Annual carbon costs (3)	1,486.0
5	Annual other gas related costs (4)	193.2
6	Total estimated gas costs incurred by Ontario customers	10,650.7

Notes

(1) Estimated commodity cost for customers who do not purchase gas from Enbridge is calculated using the weighted average commodity prices that Enbridge system sales customers paid

(2) Estimated transportation cost for customers who do not purchase gas from Enbridge is not available. Please see response at Exhibit I.1.10-ED-5, part c.

(3) Carbon costs billed to non-exempt Enbridge Gas customers are included but carbon costs associated with exempt entities registered in the Ontario Emissions Performance Standards (EPS) are not included. An EPS entity's carbon compliance costs are strictly between them and the Ontario government and therefore not publicly available. The 2022 carbon cost is subject to change pending the results of the third-party verification of Enbridge Gas's 2022 Emissions Performance Standards compliance obligation, which is expected by Q2 2023.

(4) Other costs include load balancing & storage costs

Table 4: Total Estimated Electricity Costs Incurred by Ontario Customers in 2021

Line No.	Particulars ($millions)	2021
1	Annual estimated distribution revenue (1)	4,092
2	Annual estimated cost of power (1)	13,955
3	Annual estimated transmission revenue (2)	1,792
4	Annual carbon costs (3)	N/A
5	Annual estimated government subsidies (4)	5,485
6	Total estimated electricity costs incurred by Ontario customers	25,324

Notes
(1) 2021 OEB yearbook for Electricity Distributors
(2) EB-2020-0251 Decision and Order
(3) Power producers are typically registered in the Federal Output-Based Pricing System (OBPS) and are therefore identified as exempt entities in Enbridge Gas's systems. Since an OBPS entity's carbon compliance costs are strictly between them and the federal government, and not publicly available, Enbridge Gas is unable to provide an estimate of the carbon costs.
(4) https://www.fao-on.org/en/Blog/publications/energy-and-electricity-2022

f) Please see part e) for the estimate of gas costs incurred by Ontario customers in 2022.

g) Assuming the carbon price for 2030 is \$170/tCO$_2$e or 32.4 cents/m^3, the 2020 carbon cost at 2030 rates would be \$5,373.84 million[1]. This calculation assumes Enbridge Gas's throughput is 100% natural gas. By 2030, Enbridge Gas anticipates that low carbon fuels such as RNG and hydrogen will make up a portion of the Company's total gas throughput, thus lowering the total carbon costs incurred by customers since RNG and hydrogen are not subject to the carbon charge. The total 2020 estimated gas costs incurred by Enbridge customers as provided in Table 1 using 2030 carbon rates would be \$10,781.3 million. Enbridge Gas notes that this is a hypothetical scenario, and this estimated total gas cost is not based on the Company's forecasts.

[1] This calculation takes the 2020 calendar year gas volumes subject to the carbon charge and multiplies by the 2030 carbon price. It does not consider the 2029 carbon price which would be in place from January to March of 2030. This estimate only includes carbon costs billed to non-exempt Enbridge Gas customers.

ENBRIDGE GAS INC.

Answer to Interrogatory from Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 2, Page 13

Preamble:

"According to the OEB's 2020 Yearbook of Natural Gas Distributors, Ontario's natural gas distributors received $5.1 billion in total revenue for services related to natural gas supply, transport and distribution in 2019. During the same period, the 2020 Yearbook of Electricity Distributors lists power and distribution revenues of $21.7B for Ontario's electricity distributors"

Question(s):

a) Approximately percent of gas consumed in Ontario is imported from out-of-province?

b) Approximately percent of electricity consumed in Ontario is imported from out-of-province?

c) Approximately how much did Ontario's gas consumers pay in 2020 for gas transmission costs (i.e. the cost to transport the gas to Ontario)? Please provide an estimate on a best-efforts basis and with any necessary caveats. If you do not have the upstream transmission costs for direct purchase customer volumes, please indicate that volume (m3), the average cost for upstream transmission for volumes purchased by Enbridge for its customers ($/m3), and the cost for direct purchase customers extrapolated therefrom.

Response:

a) According to the Canada Energy Regulator[1], approximately 99.7% of natural gas consumed in Ontario in 2020 was imported from out-of-province.

---

[1] Canada Energy Regulator. (2022, July 28). Energy Production. Provincial and Territorial Energy Profiles – Ontario. https://www.cer-rec.gc.ca/en/data-analysis/energy-markets/provincial-territorial-energy-profiles/provincial-territorial-energy-profiles-ontario.html Ontario average gas consumption = 2,700 mmcf/d; Ontario average gas production = 6.9 mmcf/d (99.7% of average consumption).

b) According to the IESO, in 2021 approximately 6.5% of electricity consumed in Ontario was imported.[2,3,4]

c) Enbridge Gas customers in Ontario paid approximately $375 million of transmission costs in 2020 to transport gas to Ontario. These costs include transmission costs paid by Enbridge Gas on behalf of all systems sales customers in all rate zones, bundled direct purchase customers for Union North rate zone and the western bundled T-service customers for EGD rate zones. Enbridge Gas does not believe it is appropriate to estimate the transmission costs for the remaining direct purchase customers by using the average cost paid by the above-mentioned customers because it is unlikely that this average cost would be representative of the cost of upstream transportation contracts held by individual direct purchase customers. These customers are obligated to deliver supply to various points on Enbridge Gas's system, but they are not obligated to acquire upstream transportation to these delivery locations. It is likely that many of these obligated deliveries are met by purchasing gas directly at the obligated receipt point from gas marketers and producers, and the price paid by the direct purchase customer would be reflective of any costs to move gas to the delivery location. Enbridge Gas does not have insight into the gas purchase transactions or supply arrangements of these customers.

[2] 2021 imports of electricity were 8.7 TWh. Source: IESO, Supply Overview, Imports and Exports, https://www.ieso.ca/en/Power-Data/Supply-Overview/Imports-and-Exports
[3] 2021 annual Ontario electricity demand was 133.8 TWh. Source: IESO, Demand Overview, Historical Demand, https://www.ieso.ca/en/Power-Data/Demand-Overview/Historical-Demand
[4] 8.7 TWh/133.8TWh = 0.065 OR ~ 6.5%

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 2, Page 14

Preamble:

"Enbridge Gas's residential customers will pay approximately $45/month in distribution revenues based on Enbridge Gas's proposal, which reflects the value of resiliency, reliability and security provided by Enbridge Gas's rate base."

Question(s):

a) Please provide the approximate monthly average residential distribution costs for (i) Ontario electricity customers on average and (ii) customers of Toronto Hydro.

Response:

a) Enbridge Gas does not have the information requested. There are more than 50 electricity distributors in Ontario, therefore it would take a significant amount of time and effort to review their respective rate cases for the distribution revenues associated with residential LDC customers. The $45/month in distribution revenues represents the value proposition to consumers of providing access to the safe and reliable system Enbridge Gas operates, which also carries the additional benefit of providing a distinct and separate energy delivery service for consumers along with the electricity system.

Exhibit 1, Tab 10, Schedule 2, Page 14

Question(s):

a) Please confirm that gas heating usually also requires electricity (e.g. for furnace electronics and for the blower).

b) Approximately what percent of Enbridge residential customers have backup power?

Response:

a) Confirmed.

b) In the 2020 Single Family Residential Natural Gas End Use survey, 12% of single-family residential customers indicated they had a source of back-up power. Please see Exhibit I.1.10-GEC-7, Attachment 3, page 22.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 2, Page 14
Dunsky, *Ontario's Distributed Energy Resources (DER) Potential Study*, Prepared for the IESO, September 28, 2022 (link)

Preamble:

"48. The IESO forecasts incremental capacity needs of 1,796 MW with the continued availability of existing resources in 2025; by 2032 these incremental needs are expected to grow to 3,443 MW."

Question(s):

a) Please confirm that the above-reference DER potential study found that the achievable potential for distributed energy resource by 2032 is between 1.3 and 4.3 GW.[1] Please indicate if Enbridge disagrees with this figure, and if yes, please provide Enbridge's estimate.[2]

b) Please confirm that the above-reference DER potential study found as follows:

> The economic potential results indicate there is ample cost-effective DER capacity to meet or exceed all incremental system needs under all scenarios.

[1] Dunsky, *Ontario's Distributed Energy Resources (DER) Potential Study*, Prepared for the IESO, September 28, 2022 (link), p. ES-2.
[2] Ibid.

Table E-1: System Incremental Seasonal Capacity Needs vs Economic and Achievable Potential Results

Seasonal Capacity	Potential	BAU	BAU+	Accelerated
Summer 2032	**Incremental System Needs**	**2.6 GW**	**5.6 GW**	**6.9 GW**
	Economic Potential	4.1 GW *(15% of peak demand)*	8.2 GW *(27% of peak demand)*	18.9 GW *(61% of peak demand)*
	Achievable Potential	1.3 GW *(5% of peak demand)*	2.2 GW *(7% of peak demand)*	4.3 GW *(14% of peak demand)*
Winter 2032	**Incremental System Needs**	**0.9 GW**	**6.4 GW**	**13.3 GW**
	Economic Potential	2.8 GW *(11% of peak demand)*	6.8 GW *(22% of peak demand)*	15.0 GW *(40% of peak demand)*
	Achievable Potential	1.0 GW *(4% of peak demand)*	1.8 GW *(6% of peak demand)*	3.6 GW *(9% of peak demand)*

The gap between achievable and economic potentials relates to a range of factors, including DER adoption and diffusion, market barriers, DR program participation limits and the limited financial attractiveness of some DERs to specific customers. This gap can be narrowed through actions such as improving DER compensation for services like capacity and T&D benefits, securing DERs more directly through programs or procurements, and by enhancing opportunities for DERs to participate in wholesale markets.

Please indicate if Enbridge disagrees with these conclusions, and if yes, please provide Enbridge's alternative conclusions.

Response:

a-b) Based on the quoted text in the preamble, Enbridge Gas takes the referenced evidence to be on page 19 of Schedule 2 and not page 14 as indicated.

As provided at Exhibit 1, Tab 10, Schedule 2, pages 21 to 22, the IESO has planned actions to address the referenced capacity gaps. Enbridge Gas cannot comment on the accuracy of the findings of the DER Potential Study or how the IESO will use them to meet the capacity gaps identified in their 2021 APO; however, as provided at Exhibit 1, Tab 10, Schedule 2, page 24, footnote 80, Enbridge Gas acknowledges that the DER Potential Study suggests that DERs could meet capacity deficits identified out to 2032.

Further to the above, Enbridge Gas recognizes the potential DERs could have in the future as Ontario moves through the energy transition. DERs align with Enbridge Gas's view of a diversified pathway to a net-zero economy in Ontario. The potential of DERs is demonstrated in the Pathways to Net-Zero for Ontario Report. The sensitivity analysis on the role of DERs provided at Exhibit 1, Tab 10, Schedule 5, Attachment 2, pages 50 to 51, assumed that 50% of all new solar capacity was sited behind the meter and that the costs of renewables are significantly reduced. The result is that approximately 2 GW of solar capacity is sited behind the meter as DERs by 2050. Please see response at Exhibit I.1.10-ED-46 for the installed solar capacity of the base diversified scenario in 2050.

Notes:

(1) Enbridge Gas has provided volume forecast data covering the 2023 Bridge Year, 2024 Test Year and subsequent IRM period requested in this application.

e-f) Enbridge Gas submitted the following comments during the federal government's consultation periods seeking input on the Clean Electricity Regulations:

i. Written Submission on Clean Electricity Standard Discussion Paper, provided at Attachment 1; and

ii. Written Submission on Clean Electricity Regulations Framework, provided at Attachment 2.

Written Submission on Clean Electricity Standard Discussion Paper

Submitted by Enbridge

April 14, 2022

About Enbridge

Enbridge Inc. is a leading North American energy infrastructure company. Our core businesses include Liquids Pipelines, which transports about 30% of the crude oil produced in North America; Gas Transmission and Midstream, which transports about 20% of the natural gas consumed in the U.S.; Gas Distribution and Storage, which serves approximately 3.9 million retail customers in Ontario and Quebec; and Renewable Power Generation, which has 2,172 megawatts (net) in operating renewable power generation capacity in North America and Europe. We appreciate the opportunity to provide comments on the Government of Canada's (GoC) "A clean electricity standard in support of a net-zero electricity sector" discussion paper.

Introduction

Enbridge supports the GoC's goals of having a net-zero economy by 2050. We have adopted strong greenhouse gas (GHG) emission reduction targets at our company as part of our larger Environment, Social and Governance plan, including elimination of GHG emissions from our business on a net basis (net-zero) by 2050 with an interim emissions intensity reduction target of 35% by 2030. We further support GoC establishing clear regulations and market signals now, given the long timelines for infrastructure development in the electricity sector and in the provincial regulatory frameworks required to support a net-zero grid. This proactive approach will help ensure that the transition is cost-efficient for ratepayers across the country by providing the certainty needed to inform business decision making.

There are three key principles to consider in ensuring Canada's grid continues to meet the needs of its ratepayers in a low-carbon world:

- **Reliability:** the grid must be able to deliver power to end-users when needed. This is best achieved via diverse resource types, attributes, and geographical locations complementing each other in the daily operation of Canada's regional grids.
- **Net-zero emissions:** the grid must achieve net-zero emissions but this does not have to mean producing no emissions at all. Negative emission technologies, paired with low- and non-emitting technologies, can achieve the desired environmental benefits.
- **Affordability:** Whether major power consumers spending hundreds of millions of dollars on electricity each year, or a family on a tight budget, even "small" price increases of 5%-10% can have significant impacts. The transition to net-zero should happen in a manner that meets the target but strategically approaches change to minimize avoidable costs, including long-term costs.

Enbridge submits that regulations and enabling standards developed under this consultation should continue to include consideration of these principles and provide provinces and territories the flexibility they need to also tailor their individual pathways to net-zero. For example, it may be more economical and efficient to remove carbon from other fuels and emission sources before addressing the last remaining electricity-based emissions on the pathway to net-zero in 2050; regions should have the flexibility to encourage the lowest-cost carbon abatement wherever it occurs to ensure the transition to net-zero is in keeping with the principles above.

Enbridge agrees with the GoC that the best approach for Canada to reach net-zero, with consideration for the above principles, is to acknowledge regional differences and to take an "all solutions" approach. Renewable energy and power storage will play a major role, but to meet net-zero these resources must be supported by natural gas, including when paired with carbon capture, utilization and storage (CCUS), low-carbon hydrogen, Renewable Natural Gas (RNG), and waste heat resources, among others. This approach will also be appropriate for the economy-wide targets, as not all energy consumption can be electrified, for example, natural gas-fired home heating and industrial heat applications will continue to require gas for the foreseeable future, including unabated gas, during the transition period.

A Clean Electricity Standard (CES) that incentivizes the transition to low-emitting and non-emitting resources on our provincial and territorial grids, but that does not mandate the complete elimination of fossil fuels, is the best way to ensure Canada can meet its climate commitments while maintaining the reliability and affordability of our grid.

We support the GoC's proposal to develop new interties between provinces, e.g., the Atlantic Loop project. We further support the GoC's announced spending on smart renewable energy and grid technologies, and remote and Indigenous clean energy projects. Finally, we support the Investment Tax Credits (ITC) included in the 2022 budget announcement for CCUS, and the GoC's plan to design ITCs for net-zero technologies, battery power storage and clean hydrogen, and we look forward to participating in consultations on those programs. These tax credits and other programs will provide critical financial support for emerging technologies that will play a major role in Canada's net-zero grid future. We submit similar federal support for transmission planning and development could help support the anticipated increase in renewable energy and other emissions-free power.

Enbridge looks forward to the GoC sharing proposed technical details of the CES. We have responded to the GoC questions below where we have operational and strategic experience, and we look forward to continuing participation in CES consultations in the coming months.

Response to Questions

General

1. **Should interim standards be included in the period before 2035?**

   Interim standards are unnecessary where there is a properly designed, tightening carbon pricing regime in the Output Based Pricing System (OBPS) treatment of electricity and/or the provincial equivalent programs. The discussion paper notes that the treatment of electricity under the OBPS would be addressed as part of this consultation, and Enbridge agrees that is an effective pathway to support the grid transition as we move toward the 2035 target.

   We appreciate the GoC's suggestion that robust use of offsets could be an important compliance mechanism during this transition period. Including electricity in the OBPS (and provincial programs), accompanied by clear offset protocols to enable compliance during the transition will provide the predictable market signals needed for electricity generators and major power consumers to make informed business decisions. It will also provide provincial and territorial governments and market administrators the solid regulatory underpinnings to develop needed transition plans, regulatory frameworks, and market design updates.

   We submit that the GoC's design of the offset system should be aligned with CES-based systems in existing Canadian and U.S.-based markets to the extent practical to maximize marketability and fungibility of Canadian-generated offsets, to further encourage development. Additionally, offsets should be capped at increasingly stringent rates through the transition period to ensure real emissions reductions are realized in the lead up to 2035.

2. How should the CES regulation be designed to minimize stranded capital assets and associated rate impacts?

The GoC's establishment of the CES well in advance of the 2035 target date already goes a long way to minimize future stranded assets. Insofar as the CES establishes clear, long-term signals new investments in emissions-heavy electricity resources will be minimized or avoided, and investment will focus on non-emitting and low-emitting resources.

The accommodation of hydrogen and RNG blending, CCUS, and other low-emitting technologies and retrofits, paired with offsets, will further minimize stranded assets and associated rate impacts. The inclusion of these low-emitting solutions will help natural gas-fired resources stay online during and even beyond 2035 where they can reduce or offset their emissions within the CES standards. Maximizing use of these existing assets will help ensure a cost-effective transition to net-zero under which rate increases and potential pricing volatility can be minimized for ratepayers. Gas-fired generation will also be beneficial for grid reliability and peaking support, which will support investment in, and rapid deployment of, renewable energy resources.

3. What would be an acceptable end-point emissions intensity standard to achieve the objective of the CES?

Enbridge does not have a specific number to share at this time, though we look forward to ongoing discussions on this question. The 2035 "net-zero" emissions intensity standard should not be more stringent than a natural gas plant with 95% CCUS, as anything more stringent could artificially force low-emitting gas off the grid, resulting in stranded assets, higher consumer rates, and reliability impacts. Natural gas power plants equipped with CCUS are unique among power generating resources in their potential ability to deliver net-negative carbon reductions where they may also be supplied with RNG. Furthermore, supplying RNG to natural gas power plants represents an immediate opportunity to reduce emissions from the electricity sector without requiring investments in new generation capacity or retrofitting.

4. How do considerations differ for non-competitive electricity markets, vertically integrated utilities, etc.?

Most Canadian provincial and territorial markets have limited merchant/competitive market opportunities, or none at all. All markets and utilities should be treated the same under the CES, though we acknowledge that remote and Indigenous markets may require some additional support and/or transition allowances and considerations, which we would support.

Compliance Flexibilities

5. Should the CES offer compliance flexibilities?
   - **a. What kinds of flexibilities?**
   - **b. Should the flexibilities be targeted to individual generating units? To corporate fleets of units, such as fleet averaging, etc.?**
   - **c. What constraints or limitations should be incorporated into flexibilities?**

The CES should permit compliance via several means, including,

- Adoption and development of non-emitting resources;
- Efficiency and/or operational retrofits and updates that reduce generating unit emissions;

- Retrofits and/or adoption of emissions removal technologies like CCUS;
- Incorporation of fuels that reduce emissions, e.g., hydrogen and RNG blending;
- Offsets; and
- Compliance payments.

Provinces and territories should have the flexibility to establish their own programs insofar as they would result in the same emissions reductions and net-zero end goal as the Federal CES. The compliance options above should be available in some form in all jurisdictions and should be available at the smallest compliance reporting unit under the federal or provincial rules to ensure absolute emissions reductions. The flexibilities and various compliance mechanisms should be made increasingly stringent to ensure Canada's grid stays on a steady path toward net-zero in 2035.

Provinces and territories should be able to further provide flexibility on compliance to specific generating units where there are uncommon technical, logistical, or economical barriers to compliance and where the impact to the grid of that resource leaving the grid would have immediate and significant rate and/or reliability impacts for ratepayers. Development of electricity generation resources is a years' long endeavour, even for resources with shorter development windows, due to challenging permitting environments in some areas. This is especially true where some of the technology is just now emerging. Provinces and territories working together with market administrators should have the flexibility to provide temporary, short-term compliance flexibility to a resource where it is needed to fill a gap prior to new resources or technologies coming online, especially during the transition period. This will help calm concerns about potential price volatility and/or reliability issues, which will provide certainty needed for other industries looking to invest in Canada and establish operations during this transition period.

6. **Under what conditions should offset credits available through federal, provincial/territorial, or other programs be permitted?**

   To ensure that current investments are not stranded, projects currently generating emissions reductions under provincial and territorial programs should be eligible to generate offsets, insofar they are compliant with those programs. Renewable generators should receive free emission allocations for the power produced by their renewable energy assets under OBPS in order to access the same benefits as coal and natural gas plants, which are set to receive allocations until 2030. This approach has worked well in Alberta in properly valuing various technologies with consideration for their emissions.

   During the transition period, generators subject to increasingly stringent performance standards should be able to generate surplus credits for performance improvements, including adoption of CCUS technology, alternative fuels (hydrogen and RNG) blending, and/or technical and operational changes that result in reduced emissions.

   The standards to generate offsets should be established at the time of investment and applied over a fixed period of time, e.g., number of years, for a project to incentivize adoption of these technologies and provide revenue certainty. However, the standard for offsets earned should be increasingly tightened for new projects coming online to ensure real emissions reductions occur as technology matures and we near 2035. For newer technologies, initial offset rates could be maintained until the technology reaches a particular penetration rate. In all cases, offset rules should ensure that non-emitting sources are not at a disadvantage and, therefore, artificially undervalued as they are under the OBPS today.

In addition, as noted above, offset use should be capped to ensure that it does not undermine the economics of investing in these emission-reducing changes.

7. **To what extent can negative emission technologies like BECCS and DAC contribute to meeting the obligations of a CES regulation? To what extent should they be allowed to contribute to meeting those obligations?**

   These technologies are emerging, but we anticipate they will play an important role in meeting Canada's net-zero targets for its grid and broader net-zero targets. Enbridge looks forward to the GoC providing more detail on what these compliance pathways could look like.

8. **Should compliance be assessed for the electricity sector on an annual or multi-year basis?**

   Compliance should be assessed on an annual basis, in keeping with the OBPS and existing provincial programs.

Alignment with Carbon Pricing

9. **Should the way in which electricity generation is currently treated by carbon pricing be changed to facilitate achieving NZ2035?**

   Renewable energy in provinces and territories currently under the federal backstop should be able to opt-in to the carbon pricing system under OBPS. Currently, coal and gas receive allocations that are not accessible to renewables which creates an unfair economical advantage. For example, in Alberta where renewables can participate in TIER, renewable energy investment is increasing rapidly on an annual basis.

10. **How might the treatment of electricity under the OBPS have to change to align with the CES?**

    Under OBPS, the allocations for all electricity resources should be gradually reduced to zero by 2035, and should be a requirement for provinces and territories to establish or continue operating their own programs in place of the federal backstop.

Treatment of Natural Gas Generation

11. **What is the role of natural gas in a net-zero electricity sector before 2035? Post-2035?**

    Abundant, low-cost natural gas and a deeply-integrated North American energy market is a key advantage. The natural gas industry has already made significant strides across the value chain to reduce emissions. Canadian LNG, for instance, is among the cleanest in the world as a result of using hydroelectricity for power. Using LNG for electricity generation is expected to result in an estimated 45% reduction in GHG emissions compared to coal. In addition, supplying RNG to natural gas power plants represents an immediate opportunity to reduce emissions from the electricity sector without requiring investments in new generation capacity or retrofitting. Natural gas will play a pivotal role in underpinning renewable energy globally in the long-term while immediately replacing coal powered electricity.

    It is critical to take a "whole energy sector" view when it comes to energy markets as much as possible. For example, the degree to which heating and industrial uses can be economically electrified will be a major determining factor in how the electricity sector demand and specific needs develop over the coming decades as we move toward a net-zero economy in 2050. Looking at the electricity sector in isolation could result in incomplete planning and uneconomical approaches to net-zero.

In the case of the electricity sector, existing (and near-term new) natural gas paired with CCUS and/or blended with non-emitting fuels like hydrogen and RNG, will be a reliable, economical source of electricity that can support increased adoption of renewable energy and power storage resources, as Canada's electricity demand grows. In addition, provinces and territories should have the authority to move toward the net-zero by 2035 requirement at a pace that ensures reliability and minimizes cost of power increases, which may include continued use of unmitigated natural gas in the near-term.

Major power consumers spending hundreds of millions of dollars on power, as well as families on a tight monthly budget would all be impacted by even relatively small 5%-10% price increases. Price uncertainty and/or increases could create operational cost uncertainty and deter new investment from other industries considering Canada for their operations. A strategic and thoughtful, regional approach to natural gas before and after 2035 will maximize reliability and cost management benefits for Canadians, while keeping all regions on track toward net-zero by 2035.

Natural gas also has multiple pathways toward operating as a low-emitting source of power. The GoC's CCUS ITC as proposed in its 2022 budget, and its plan to develop an ITC for clean hydrogen, along with support for RNG development will help these technologies mature and will result in lower per-unit costs. These technologies will enable natural gas to remain on the grid while still reducing emissions and will minimize stranded assets and transition costs for ratepayers.

Use of these existing gas resources will also provide support for the anticipated boom in renewable energy investment needed to meet Canada's net-zero targets, while power storage technologies undergo their own maturation and cost reductions. The GoC's proposed plan to implement a battery power storage ITC will further accelerate these cost reductions and technology improvements.

12. **What flexibility should be allowed to use natural gas to maintain reliability in rare and extreme weather, emergencies, or other special circumstances? Which additional operating conditions/scenarios, if any, should be given special consideration?**
    a. **If natural gas has an electricity system-support role post-2035, what are the expected impacts on the rollout of emerging system support technologies such as energy storage?**
    b. **If natural gas has a role in generation post-2035, what are the expected impacts on the penetration of nascent generation technologies like SMRs, geothermal electricity, etc.?**

Natural gas-fired generation, paired with CCUS should be considered a low-emitting electricity resource, or even a non-emitting or negative-emission resource if CCUS is paired with RNG or green hydrogen blending. Gas' ability to provide power during weather extremes and other special circumstances is an important benefit of gas (depending on the weather extreme, e.g., solar may be as reliable a resource during a long hot summer), but it is not the only reason to keep natural gas on the grid. In the event CES enables low-emitting gas-fired generation to remain part of Canada's energy mix beyond 2035, there would be no need for special considerations.

As described above, Enbridge supports an "all solutions" approach to net-zero where the GoC and provinces/territories do not pick one low-emission solution over another. Wind and solar power are two of only a very few, non-emitting resources available in Canada. Wind and solar are the lowest cost electricity of any kind in Canada due to decades of technology improvements. Solar paired with battery power storage is also on track to be less expensive than natural gas (without CCUS) in the very near future. As a result, wind and solar, with power storage, will be the lowest-emission, lowest-cost resources available and they will thrive where there are no artificial barriers to their development established by provincial/territorial governments, regardless of low-emitting gas' smaller ongoing role on the grid. Wind and solar will also be able to pair with other forms of power storage that will become increasingly cost-competitive over time, including pumped hydro, hydrogen, and new emerging technologies, which will enable longer-term storage options for emission-free renewable power.

It will be important to consider the whole cost of power in system planning as well, e.g., including the cost of transmission, which will help ensure that non-wires alternatives, self-supply, and demand management technologies are properly valued and fully enabled under provincial regulations.

Policies should focus on ensuring the renewable resources have equal access to procurement processes and interconnections, receive allocations under the OBPS, and receive ITCs for power storage projects, as set out in the GoC's 2022 budget. In all cases, GoC's support of natural gas, CCUS, hydrogen, and RNG could be maintained, as part of the "all solutions" approach.

Treatment of Industry, Private Generation and Remote Generation

13. **How should the CES treat electricity generated by cogeneration units that is sold to the electricity system? Should the CES apply fully to cogeneration units by 2035 or should it phase-in its application to cogeneration units after 2035?**

    Enbridge submits that cogeneration is typically a relatively (to other fossil fuel-based generation) low-emitting generation resource. It is also cost-efficient, which helps keep rates affordable for large power consumers and residential ratepayers alike. Emissions from cogeneration must be captured as part of the broader net-zero economy by 2050 framework, but that it is important that the emissions are captured under the correct framework, e.g., OBPS or CES, at the right time, and that the compliance requirements are established with regional consideration of available alternatives, costs, emissions reductions, and other goals. For example, it is not necessary to resolve all net-zero questions at this time, and cogeneration, along with biomass and remote generation, could be addressed once the larger standards and compliance mechanisms are established.

14. **What are the benefits of applying a CES to industrial generation units? What are the challenges of doing so? Of not doing so?**

    See above.

15. **How should the CES consider electricity generation in remote, northern, and Indigenous communities?**

    No comment at this time.

16. **How should the CES consider distributed energy resources?**

Distributed energy resources encompass many different forms of electricity resources, so we have divided the category into subcategories below for clarity.

Enbridge submits that distributed energy resources generating electricity, e.g., behind the meter (BTM) power projects, distribution connected generation, etc., should be subject to the same CES requirements as other electricity generation resources. To do otherwise under the CES could see higher-emitting resources move behind the meter instead of taking steps to reduce emissions via CCUS and/or fuel blending, or transition to renewable resources.

To the extent this question refers to distributed energy resources providing demand response and other demand side services, but not generating electricity on their own, they should not be required to comply with the CES as they are only storing and disbursing electricity already generated elsewhere. However, we submit that demand-side programs could be eligible to generate offsets under clearly defined protocols that avoid double-counting with offsets and/or other credits generated under other programs like OBPS, Clean Fuels Regulation, or others that may be established at the provincial or federal level.

Treatment of Biomass

17. **If CO_2 emissions from biomass combustion are not counted towards compliance under a CES, to what degree might biomass generation increase?**
18. **What types of biomass are suited to electricity generation? What are their characteristics with respect to regenerative life cycle, non-CO_2 GHG emissions, and land use characteristics?**
19. **What emissions reporting and compliance requirements for biomass generation should be considered to ensure that nature is protected and land-based emissions do not increase?**

No comment at this time.

Other Questions

20. **What additional investments are anticipated to be necessary to achieve NZ2035 to help ensure affordability for consumers?**

Enbridge supports the GoC's spending announcements to date, including its 2022 budget plan, and the additional spending set out in its Emissions Reduction Plan. The ITCs for CCUS, clean hydrogen, and power storage will play a critical role in supporting development of new projects in these emerging technologies, which will help them mature and lower per-unit costs more rapidly. This will help avoid stranded assets and will maximize use of existing infrastructure which will minimize the transition cost for ratepayers. These incentives will also help position Canada as a leader in these important net-zero technologies, which could provide important economic and employment opportunities for Canadians, including creation of technology and/or manufacturing hubs in Canada.

A transmission ITC could also help support the transmission development GoC proposed between provinces, especially if also paired with permitting and regulatory frameworks and backstops at the federal level for inter-jurisdictional connections.

The provinces and territories' adoption of clear regulations and market mechanisms in support of grid modernization (including power storage) will also be critical in ensuring that the lowest-cost solutions are incorporated into the grid transition to net-zero.

Finally, clear, long-term market and policy signals will provide the certainty needed to minimize cost of capital for new development and/or retrofits of all kinds. This is a critical means of ensuring that electricity remains affordable for Canadian ratepayers.

21. What role could existing and expanded energy efficiency programming play in helping to meet new demand as they transition towards net-zero 2035? What are the constraints for additional efficiency measures? Technological? Policy? Other?

The cleanest source of electricity is electricity not used. Energy efficiency programming will play a key role in meeting new demand by offsetting it with reductions elsewhere on the grid. Public awareness campaigns, support for smart grid and other grid modernization technologies, ITCs for energy efficiency investments, retrofits, etc., could go a long way toward improving and incentivizing adoption.

22. What other factors should the government consider in developing the CES?

We understand the details in Annex A, Table 1 were taken from EIA and IEA reports but the development lead times on certain technologies (e.g., SMRs, large hydro, large nuclear) are optimistic and even the wind and solar lead times are too short for certain jurisdictions in Canada where permitting and interconnection challenges make for longer development and construction periods. We suggest that the GoC work with (and possibly provide financial support for) provincial and territorial governments to improve permitting efficiency.

Enbridge believes it is also optimistic to list SMRs at a level 6-9 in the technology readiness analysis given that offshore and onshore wind, and PV solar are also listed at level 9. For example, there are over 16 GW of wind and solar installed in Canada alone and, to Enbridge's knowledge, no SMR capacity installed. We submit SMRs should be listed at the levels of natural gas plus CCUS as an upper limit, i.e., level 5-6. A reasonable assessment about the readiness and affordability of technologies is important to ensure that existing power supply is not scheduled for removal from the grid artificially early in the pathways to net-zero planning processes, as such actions could lead to reliability issues and price increases.

Finally, transparent, timely, and accessible inventory reporting will be critical to ensure we meet the targets, and to help customers, utilities, and power generators make their respective investment and market participation determinations in an informed and efficient manner that minimizes avoidable costs.

Conclusion

Thank you for this opportunity to provide input on the Clean Electricity Standard. If you have any questions, please do not hesitate to contact amanda.affonso@enbridge.com

Written Submission on Clean Electricity Regulations Framework

Submitted by Enbridge

August 17, 2022

About Enbridge

Enbridge Inc. is a leading North American energy infrastructure company. Our core businesses include Liquids Pipelines, which transports about 30% of the crude oil produced in North America; Gas Transmission and Midstream, which transports about 20% of the natural gas consumed in the U.S.; Gas Distribution and Storage, which serves approximately 3.9 million retail customers in Ontario and Quebec; and Renewable Power Generation, which has more than 1,766 megawatts (net) in operating renewable power generation capacity in North America and Europe. We appreciate the opportunity to provide comments on the Government of Canada's (GoC) "Proposed Frame for the Clean Electricity Regulations" (CER).

Introduction

Enbridge supports the GoC's goals of achieving a net-zero economy by 2050. We have adopted strong greenhouse gas (GHG) emissions reduction targets at our company as part of our larger Environment, Social and Governance plan, including elimination of GHG emissions from our operations on a net basis (net-zero) by 2050 with an interim emissions intensity reduction target of 35% by 2030. We further support GoC establishing clear regulations and market signals now, given the long timelines for infrastructure development in the electricity sector and in the provincial regulatory frameworks required to support a net-zero grid by 2035. This proactive approach will help ensure that the transition is cost-efficient for ratepayers across the country by providing the policy certainty needed to inform business decision making.

Enbridge agrees with the GoC's three key pillars of its CER framework, including GHG emissions reductions, reliability, and affordability, and its "all solutions" approach. Renewable energy and power storage will play a major role, but to meet net-zero these resources must be supported by natural gas, including when paired with carbon capture, utilization, and storage (CCUS), along with clean hydrogen, renewable natural gas (RNG), and waste heat resources, and others. This includes new unabated natural gas-fired generation, particularly in the western prairie provinces, for the coming years. Regulations and enabling standards developed through this consultation should work to balance the three key pillars, while providing developers of all technologies the clarity and regulatory certainty needed to make the necessary investments. We recommend that a guiding principle for the CER should be to adopt policies that incentivize early-action from those with emitting resources in their fleet, as detailed below.

Canada has excellent resources and infrastructure and is well-positioned to meet the challenge of moving to a net-zero electricity grid. However, recent global developments, including Europe's move to reduce its dependence on Russian natural gas and the passage of the *Inflation Reduction Act* in the United States, will put incredible pressure on the economics of building in Canada. Incentives and new supply chains focused outside of Canada will provide strong competition for investment dollars and may divert financial and development resources. GoC has already proposed and is in development of key initiatives that would help overcome this competitive disadvantage, including the tax credits for CCUS, power storage and clean hydrogen, and we encourage GoC to complete work on those tax credits as soon as possible. We further support the GoC's proposal to develop new interties between provinces, e.g., the Atlantic Loop project and its announced spending on smart renewable energy and grid technologies, and remote and Indigenous clean energy projects. Finally, we recommend that GoC consider tax credits for transmission development and RNG to help advance much needed projects in support of net-zero objectives. These tax credits and other programs will provide critical financial support for emerging technologies that will play a major role in Canada's net-zero grid future.

We have provided detailed comments on GoC's proposal details below, including:

- GoC should provide more specific detail on several items, including a definition of "emergency," anticipated carbon pricing beyond 2030, and standards for new gas coming online post-2022.
- GoC should complement tax credits for hydrogen, CCUS, and power storage with incentives for early action including the ability to generate and carry forward credits for meeting CER standards even if not yet subject to CER, and special incentives and/or tax credits for negative emission technologies (e.g., RNG)
- CER should cover generating resources not already covered under other regulatory frameworks and/or if CER becomes the default regulatory framework to cover all electricity generation, the rules by which certain existing assets are moved from under existing emissions regulation frameworks must be done in a way that does not penalize those relying on Behind-the-Meter (BTM) generation and/or cogeneration for compliance with other regulations.
- The prescribed life – or the period during which gas reaching commercial operation prior to 2025 can continue to operate unabated – should be at least 20 years, in keeping with typical commercial assumptions.
- GoC should establish a market mechanism linked with Canada's Offset Credit System to maximize use of the existing system and fungibility of credits created under CER. This should also be interoperable with provincial and international (including US) systems.

Enbridge looks forward to continuing participation in CER consultations in the coming months.

Comments on Framework

Scope of application

The CER would regulate emissions of carbon dioxide (CO_2) from electricity generating units that meet all of the following criteria:

- *Combust any amount of fossil fuel for the purpose of generating electricity;*
- *Have a capacity above a small megawatt (MW) threshold (value to be determined); and*
- *Offer electricity for sale onto a regulated electricity system.*

Enbridge generally supports the proposed scope of application. It is our understanding from GoC's webinar that the small MW threshold being considered is smaller than 250 kW. We would also support exemptions for projects at some MW threshold below that size, with consideration for the tonnes of carbon dioxide equivalent (tCO2e) emitted by the facility, to ensure that smaller facilities are not expected to invest in potentially costly retrofit technologies to avoid only small GHG emissions volumes.

We further support focusing on Front-of-the-Meter development, insofar as Behind-the-Meter (BTM) development is captured under other GHG emissions regulations such as OBPS and/or CFR, and insofar as the standards under those programs are as stringent as the CER with the same options to generate offsets and/or performance credits for GHG emissions reductions, e.g., swapping natural gas-fired co-gen for BTM solar.

Proposed emissions standard

- *The CER would establish an emissions performance standard having an intensity form (i.e., t/GWh). It would be set at a stringent, near-zero value in line with direct emissions from well-performing, low-emitting generation such as, geothermal or combined cycle natural gas with CCS.*
- *A regulated unit would be prohibited from operating when its quantified emissions performance exceeds the applicable standard over a period of time.*
- *Any residual emissions below the standard would be subject to financial compliance requirements, such as offset purchases.*
- *Some exemptions are proposed.*

Enbridge generally supports the proposed emissions performance standard of a near-zero value in line with low-emitting generation such as geothermal or natural gas combined cycle with CCS. This will encourage adoption of non-emitting sources such as wind, solar, offshore wind, clean hydrogen, and RNG-fired generation, while still providing room for conventional natural gas to continue playing a key role in system reliability for years to come where it is paired with CCUS and/or other abatement technologies.

As clean hydrogen, RNG, and power storage technologies mature, and particularly as carbon capture, use and storage technologies are scaled-up and become more widespread, it may be possible to increasingly tighten the GHG emissions performance standard to ensure that the grid continues to move as close to zero emissions as possible in a way that does not lead to significant price increases for Canadian ratepayers. We reiterate our support for GoC's tax credits and other financial programs to support development of clean hydrogen, RNG, CCUS, and power storage, and encourage GoC to make sure these incentives and funding programs are competitive with those in the United States and elsewhere to keep the investment and development resources in Canada and to help these technologies and Canadian markets mature.

Affordability and Reliability

To support affordability and reliability while achieving net zero, the following approaches are proposed:

- *Compliance can be achieved through a variety of technologies, and the regulations will be technology-neutral, e.g., co-firing fossil fuels with non-emitting fuels, completely switching to these non-emitting fuels, such as hydrogen, ceasing operations, and/or installing abatement technologies. The regulations will not be prescriptive on which approach should be taken.*
    - *A phase-in of the CER requirements would allow newer natural gas units built prior to the CER publication date to operate past 2035 for a short, prescribed period.*
- *Unabated natural gas would be allowed during emergency circumstances.*
- *Existing units that have reached their end of prescribed life could continue to generate electricity to provide backup to variable renewable electricity if they meet the following conditions:*
    - *They emit less than [TBD] kilotonnes per year; and*
    - *They operate less than [TBD] number of hours per year.*

Enbridge supports GoC's efforts to provide compliance flexibility to ensure affordability and reliability of Canada's electricity systems are maintained for energy consumers.

A CER framework that does not address regional variability could disproportionally impact some provinces more than others. We understand from the GoC's webinar that the Government's analysis concluded Alberta is not in a position to transition directly from coal to all renewables, and that new natural gas-fired generation will be required in the coming years to enable the province's transition to a low-emitting and eventually net-zero electricity system, while maintaining reliability and affordability. The proposed "prescribed life" will help support system reliability while moving Canada steadily toward a net-zero grid. Similarly, other provinces may have difficulty meeting the requirements of the proposed CER while maintaining electricity affordability and reliability. Enbridge supports an "all solutions" approach to ensure that all commercially available technologies can be used as suits each region to meet the energy, capacity, and resiliency needs of an affordable and reliable grid. This would include renewables, power storage, hydrogen, RNG, CCUS, and – for a prescribed time and in emergency circumstances – unabated gas, as proposed by GoC.

The ability to provide energy when consumers need it, including on the hottest and coldest days of the year, and when extreme weather events occur, is critical. ERCOT's experience in Texas demonstrated on many levels that a lack of reliability in electricity and gas supply can have significant economic and human health and safety impacts. Enbridge supports the provision that natural gas would be allowed in emergency circumstances, however there are practical realities that need to be considered to support this provision. For natural gas to act as an emergency generation source, access to natural gas assets, including transmission, storage, and distribution assets, needs to be available. These assets will not be held available as an option for power generators to use when they see fit. Access to the capacity required for power generation is held under firm contracts, and any excess capacity on the natural gas system will be sold to the broader the market. Power generators will need a market mechanism to allow them to sign-up for these services, so they are available when called upon to produce power. Additionally, there will be a need to run gas-fired assets periodically to ensure they are functional when called on in an emergency. Allowances should be made to allow gas-fired generation to run on a regular basis to ensure those assets are available in emergency circumstances, as below.

More clarity in standards and definitions under these parts of the CER, will allow more affordability benefits to be realized. For example, investors in all generation technologies will require certainty about the intent, limits, and effect of the regulations to investment in new sources of electricity generation, transmission, and storage projects.

As a result, Enbridge recommends:

- To ensure compliance flexibility will truly be available, GoC should review the technology readiness and feasibility of the various technologies that could be used to achieve compliance, as well as the technologies that will be relied upon to replace gas-fired generation. For example, hydrogen-ready turbines (new and/or retrofit) and Small Modular Reactors (SMRs) will likley be available in time, but the timing should be more specifically forecast along with anticipated, related costs.
- To avoid disproportionally impacting jurisdictions, a jurisdictional lens should be placed on the technology evaluation, as technologies that are feasible in one jurisdiction may not be feasible in another. Additionally, Enbridge suggests regional discussions be held for each province, which should include both ECCC and NRCan, as well as members of provincial government, electricity system operators, and other relevant stakeholders.

- GoC provide a more direct and specific definition that is less open to interpretation, on a facility-by-facility and system operator basis, of “extraordinary, unforeseen and irresistible” for “emergency.” We agree with the Canadian Renewable Energy Association (CanREA) that the North American Electric Reliability Corporation (NERC) standard definition of emergency is familiar to all generators and could provide a clear and consistent definition.
- To ensure gas-fired assets are available in emergency circumstances, GoC should provide an exemption that allows gas-fired assets to be run on a regular basis. Reasonable limits for this exemption should be set through public consultation.
- The “prescribed life” should be set to at least 20 years, which is a standard initial operating period for most generation projects. It is shorter than some technologies but long enough to ensure a reasonable rate of return and to investigate potential retrofit technology options. The prescribed life would start on the commissioning date, e.g., the date of the facilities first sale of electricity to the electricity system. The CER would then apply to a facility entering operation before 2025 at the later of 2035 or the end of the Prescribed Life. Enbridge also suggests that the term “Prescribed Life” could be more aligned with its intent. Enbridge suggests the term “Unabated Life” is as a more accurate term and would avoid any confusion from the term “Prescribed Life” which could be misinterpreted as limiting the operational life of fossil fuel power generating assets.
- GoC could also establish incentives to encourage emitting facilities to reduce GHG emissions in advance of the 2035 CER-applicability deadline, e.g., by allowing them to generate offsets and/or performance credits once they drop below a best-gas threshold in effect in any year before the end of their prescribed life and permit those generators to sell the credits and/or to carry them forward to be used in their own early compliance periods. This could incentivize early development of RNG, clean hydrogen capacity and increased investments in CCUS, which will also help other parts of Canada’s net-zero economy.
- GoC should provide clarity on anticipated carbon pricing between 2030 and 2035, and beyond if possible. This will be a crucial financial input to investment decisions and planning.

Proposed Implementation Approach and Associated Dates – New Units

Treatment of all units firing gaseous, liquid, or solid fossil fuels

- *A unit commissioned in 2025 or after would be subject to current electricity sector policies (the federal phase-out regulations for unabated coal, the federal performance standards for new natural gas, and carbon pricing) until January 1, 2035. Starting on January 1, 2035, the CER and its performance standards and the associated financial compliance component would replace current electricity sector policies.*
- *While the CER limits would only become binding in 2035, it is expected that they will deter any unabated new fossil fuel-fired generation in Canada. The decision to commission a new unit after 2025 will need to take into consideration the CER obligations. As continued operation after 2035 will require the installation of abatement technology, these units will need to resolve the financial implications of having to comply with the CER obligations even in their initial project development.*

Enbridge supports GoC’s proposal on the treatment of new gas before and after 2035. As noted above, we recommend:

- GoC could establish financial incentives to encourage emitting facilities to reduce GHG emissions in advance of the 2035 CER-applicability deadline, e.g., by allowing them to generate offsets and/or performance credits once they drop below a best-gas threshold in effect in any year before the end of their prescribed life. These offsets and/or performance credits could be sold to other emitters with compliance requirements and/or retained for compliance obligations post-2035, subject to broader longevity rules established for offsets under the CER.
- GoC should provide clarity on anticipated carbon pricing between 2030 and 2035 (and beyond). This will be a crucial financial input to investment decisions and planning.

Proposed Implementation Approach and Associated Dates – Existing Units

Treatment of all units firing gaseous, liquid, or solid fossil fuels

- *A unit commissioned before 2025 would become subject to the CER's emission intensity performance standard at the end of its prescribed life, or, on January 1, 2035.*
- *The definition of prescribed life is a topic that requires further consideration. It could be defined as a period of fixed years starting with its commissioning date, i.e., the date of its first sale of electricity to the electricity system.*
- *An existing unit would be subject to current electricity sector policies until it becomes subject to the CER and its performance standard.*

Enbridge recommends that the prescribed life be set at a minimum 20 years from the date of commercial operation to ensure that generators can recover their investment without increasing electricity prices while also ensuring that the emitting sources do not linger on the grid. The GoC could provide incentives for existing generation to reduce GHG emissions in advance of the end of their prescribed life by making them eligible to generate performance credits and offsets to some degree if they can reduce GHG emissions below a specific threshold, e.g., best gas in the particular year or some reduced level from best gas, as they move toward the CER-applicability deadline at the end of their prescribed life. These generators could then sell the credits to other emitters or carry them forward to their own early-compliance periods. This could encourage early development of RNG and/or clean hydrogen capacity and CCS projects, which will also help reduce GHG emissions in other parts of Canada's energy sector.

Proposed requirements for financial compliance for all emissions below the regulatory limit

- *In addition to ensuring that all regulated units operate within the stipulated limits, regulated units would be required to compensate for any emissions released to the environment.*
- *This requirement would begin in 2035 for both new units and existing units, as defined above.*
- *The eligible forms of financial compliance are to be determined but could include the production or purchase of prescribed high quality offsets, including verified negative emissions, or paying an amount that corresponds to the federal carbon price for the relevant compliance period.*
- *Emissions for units operated in emergency situations would be exempt from financial compliance requirements.*

Enbridge generally supports this proposal, subject to our recommendations above.

In addition, we recommend that a CER-based market mechanism be linked with Canada's GHG Offset Credit System to enable greater fungibility and opportunities to mobilize reinvestment in the further decarbonization of the grid. This would also avoid the necessity to establish an entirely new, stand-alone market and leverage existing regulations, quantification methodologies, etc. We also believe that the inclusion of verified negative emissions (i.e., direct air capture and nature-based solutions) requires a linkage with a broader carbon market as these types of projects would not likely occur within the context of the CER.

Finally, recognizing that the CER is intent on achieving a net-zero grid we recommend that credit usage limits be enacted with a decreasing trajectory to ensure that absolute GHG emissions reductions occur.

Potential compliance flexibility

The use of fleet averaging approaches could ease compliance burdens and incentivize the build out of renewables.

Enbridge generally agrees that fleet averaging approaches could ease compliance burdens and incentivize build out of renewables, CCS, power storage, clean hydrogen and RNG technologies. However, it should not enable the largest generators to continue emitting while generators with smaller portfolios are left to carry most of the responsibility for reducing GHG emissions. It should also not force generators to aggregate or impose unfair disadvantages on those who do not, reducing competition in Canada's electricity markets. We look forward to ongoing discussions with GoC on this topic.

Proposed treatment of industrial units

- *The CER would only regulate industrial units (including cogeneration) that offer electricity for sale to the electricity system.*
- *The CER would not generally regulate a cogeneration unit that generates electricity for its own needs, i.e., "self-consumption" of electricity generated and consumed behind the industrial fence line. Other regulatory and pricing measures would continue to apply to those emissions.*
- *This treatment of cogeneration units could be revisited later. The CER could then potentially require all cogeneration units to meet the same standards as those units offering electricity for sale to the electricity system.*

Enbridge generally supports GoC's proposal insofar as industrial units are captured under other regulatory regimes, e.g., OBPS, and that those regulatory regimes are as stringent as the CER. This will enable operators to make the most economic investment decisions, preserving affordability and reliability, while still resulting in meaningful GHG emissions reductions. We further agree that issue should be revisited to avoid unintended consequences of the proposal that could undermine the CER.

Proposed exemptions from the CER performance standards for regulated units

The CER would allow for two categories of exemptions:

- *Units would be allowed to supply electricity to the electricity system without having to meet either a performance standard or the requirement for financial compensation for emissions during emergency circumstances, which are defined as "extraordinary, unforeseen and irresistible."*
- *Units operating in areas not connected to an electricity system regulated by the North American Electric Reliability Corporation ("NERC") would be exempted. These areas are predominately remote, Northern or on federal lands.*

Enbridge generally agrees with GoC's proposal, subject to the clarifications requested above, including:

- GoC should provide a more direct and specific definition that is less open to interpretation, on a facility-by-facility and system operator basis, of "extraordinary, unforeseen and irresistible" for "emergency." We agree with CanREA that the NERC standard definition of emergency is familiar to all generators and could provide a clear, consistent definition.
- GoC should provide reasonable limits on natural gas-fired generation during emergency events instead of allowing completely unabated production. There may be non-emitting resources available for electricity generation during emergency events that could be uneconomical compared to non-emitting natural gas but that would still be economical for ratepayers. Insofar as there would not be a significant ratepayer impact, the non-emitting resources should continue to be relied upon and prioritized during emergency events.
- We reiterate that gas will need to be run regularly, subject to reasonable limits to be determined via public consultation, in order to ensure that the gas system (including storage, transmission, etc.) is in working order and available during emergency events.

Conclusion

Thank you for this opportunity to provide input on the Clean Electricity Regulations. If you have any questions, please do not hesitate to contact amanda.affonso@enbridge.com

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 3, Page 2

Preamble:

“6. Ontario’s GHG emissions in 2020, the last year for which data are publicly available, were 150 million tCO2e. Enbridge Gas’s scope 1 and 2 emissions are less than 1% of Ontario’s GHG emissions and the scope 3 GHG emissions from combustion of natural gas by Enbridge Gas’s end-use customers are approximately 32% of Ontario’s emissions.2 Enbridge Gas’s scope 3 GHG emissions by sector are provided in Figure 1.”

Question(s):

a) Please confirm that the emissions referred to above do not include the upstream emissions from the extraction of gas at its source and transportation to Ontario.

b) Please provide Enbridge’s best estimate of the upstream carbon emissions (tCO2e/m3) attributable to Ontario’s gas consumption. As Ontario’s gas comes from a variety of sources, please provide a best estimate with any necessary caveats. Please also provide the underlying calculations, such as the upstream emission intensity. Please also provide a high and low range estimate of this figure representing the differing scientific views on the upstream carbon emissions.

   This is relevant, among other things, to the probability that the lifecycle carbon emissions from gas will result in policies and market forces that significant reduce or eliminate gas consumption before the end of the life of assets to be built during the rate period.

c) Please also provide the gross upstream carbon emissions associated with Ontario’s total gas consumption (tCO2e).

d) Please provide the total non-rounded Ontario 2020 GHG emissions (tCO2e) and the combined Enbridge scope 1, 2, and 3 emissions.

Response:

a) Confirmed.

b-c) Enbridge Gas does not calculate the upstream carbon emissions attributable to Ontario's gas consumption and therefore does not have the requested data.

d) Ontario's 2020 GHG Emissions were sourced from Table A11-13 of the National Inventory Report 1990-2020[1] and are presented as rounded numbers in that report.

The non-rounded 2021 Enbridge Gas combined scope 1, 2, and 3 emissions are provided in the table below:

Emissions Category	2021 Emissions (tCO_2e)
Scope 1	888,654
Scope 2	1,026
Scope 3	48,324,031
Total	49,243,711

[1] National Inventory Report 1990 – 2020: Greenhouse Gas Sources and Sinks in Canada, April 14, 2022, Part 3, p.27, https://unfccc.int/documents/461919

ENBRIDGE GAS INC.

Answer to Interrogatory from Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 3, Page 2

Preamble:

Table 1
Enbridge Gas GHG Emissions (1)

Line No.	Emissions Category (2)	Description	2021 Emissions (Million tCO_2e)
1	Scope 1	Emissions from Enbridge Gas's operations: combustion, flaring, venting and fugitives	0.9
2	Scope 2	Emissions from off-site generation of electricity, which Enbridge Gas buys and consumes	0.001
3	Scope 3	Emissions from combustion of natural gas by the Company's end-use customers.	48.3
4	Total		49.2

Question(s):

a) Please confirm that scope 3 emissions also include emissions from unburned methane gas emitted by end-use customers. If not, please explain why not.

b) What definition of scope 1, 2, and 3 emissions does Enbridge use?

c) Please provide a table comparing the definition of scope 1, 2, and 3 emissions per (i) Enbridge's practices/policies, (ii) the GHG Protocol, (iii) ICO 14064, and (iv) the United Nations Framework Convention on Climate Change.

Response:

a) Confirmed. Please see response to Exhibit I.1.10-ED-12 part a).

b) As indicated in Exhibit 1, Tab 10, Schedule 3, page 2, Table 1, Note 2, Enbridge Gas follows the definitions of GHG emissions outlined in The Greenhouse Gas Protocol[1].

c) As noted above, Enbridge Gas follows the definitions outlined in the Greenhouse Gas Protocol. Please see the following links to understand the emission definitions utilized by the identified organizations. Enbridge Gas notes that each of these organizations uses different categorizations of emissions and therefore any attempt to summarize in tabular form might create inadvertent mischaracterizations.

- GHG Protocol: Please see The Greenhouse Gas Protocol, A Corporate Accounting and Reporting Standard, March 2004, p. 25, https://ghgprotocol.org/sites/default/files/standards/ghg-protocol-revised.pdf.

- ISO 14064: Please see ISO 14064-1:2018: Greenhouse gases – Part 1, Annex B, https://carbon.landleaf-tech.com/wp-content/uploads/2022/04/ISO14064-1-2018.pdf. Please note that ISO does not use the terms scope 1, 2 and 3, but instead uses categories to delineate direct and indirect emissions. Please see Annex B for definitions of ISO's emissions categories (category 1, 2, 3, 4, 5, and 6)

- United Nations Framework Convention on Climate change (UN FCCC): Please see 2006 IPCC Guidelines for National Greenhouse Gas Inventories, https://www.ipcc-nggip.iges.or.jp/public/2019rf/vol1.html. The UN FCCC guideline is designed for national emissions reporting as opposed to corporate emissions reporting. As such, although the UN FCCC guideline does use the terms direct and indirect emissions, the terms are used in a different context than in corporate inventories. The UN FCCC guideline does not use the terms scope 1, 2 and 3.

[1] The Greenhouse Gas Protocol, A Corporate Accounting and Reporting Standard, March 2004, p.25, https://ghgprotocol.org/sites/default/files/standards/ghg-protocol-revised.pdf

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 3, Page 2

Preamble:

"6. Ontario's GHG emissions in 2020, the last year for which data are publicly available, were 150 million tCO2e. Enbridge Gas's scope 1 and 2 emissions are less than 1% of Ontario's GHG emissions and the scope 3 GHG emissions from combustion of natural gas by Enbridge Gas's end-use customers are approximately 32% of Ontario's emissions.2 Enbridge Gas's scope 3 GHG emissions by sector are provided in Figure 1."

Question(s):

a) Please confirm that the emissions noted above do not include unburned methane emissions from residential natural gas appliances. If they do, please provide a breakdown.

b) Please provide Enbridge's best estimate of the unburned methane emissions from residential natural gas appliances (Ontario total, CO2e). Please make and state assumptions as necessary and include caveats as necessary.

c) If it differs from the answer to (b), please provide Enbridge's best estimate of the unburned methane emissions from residential natural gas appliances (Ontario total, CO2e) based on Zachary Merrin and Paul W. Francisco, *Unburned Methane Emissions from Residential Natural Gas Appliances* (link). Please make and state assumptions as necessary and include caveats as necessary.

d) If it differs significantly from the answer to (c), please provide Enbridge's best estimate of the unburned methane emissions from residential natural gas appliances (Ontario total, CO2e) based on Patricia M. B. Saint-Vincent and Natalie J. Pekney, *Beyond-the-Meter: Unaccounted Sources of Methane Emissions in the Natural Gas Distribution Sector* (link). Please make and state assumptions as necessary and include caveats as necessary.

e) With reference to these academic studies:

Quantifying Methane Emissions from Natural Gas Water Heaters (link)
Unburned Methane Emissions from Residential Natural Gas Appliances (link)
An Estimate of Natural Gas Methane Emissions from California Homes (link)
Beyond-the-Meter: Unaccounted Sources of Methane Emissions in the Natural Gas Distribution Sector (link)
Methane and NOx Emissions from Natural Gas Stoves, Cooktops, and Ovens in Residential Homes (link)

Please provide a summary table of the results indicating, where available, for each equipment type: (i) the estimated unburned methane emissions (tCO2e/m3); (ii) the estimated unburned methane emissions per year on average (t/CO2e/yr); and (iii) the estimated unburned methane emissions as a percent of gas consumption (m3/m3).

f) What is the impact of 1 m3 of methane gas combusted in Ontario (tCO2e) versus 1 m3 of methane gas emitted to the atmosphere without combustion (tCO2e).

g) Based on Enbridge's residential gas equipment survey results, please provide a table showing the number of customers with a gas: furnace, stove, tank water heater, tankless water heater, and fireplace.

h) Please file the latest copy of Enbridge's residential gas equipment survey results.

Response:

a) The Scope 1 and 2 emissions do not include emissions from residential natural gas appliances. The Scope 3 emissions do include unburned methane emissions from end-user natural gas appliances.

b) Enbridge Gas's Scope 3 emissions include only in-franchise natural gas customers in Ontario. Enbridge Gas's best estimate of the unburned methane emissions from end-use of natural gas by the Company's in-franchise natural gas customers is 0.02 million tCO_2e. This estimate is calculated based on the methane emission factor for natural gas combustion by residential, construction, commercial/institutional, and agricultural uses sourced from the Guideline for Quantification, Reporting and Verification of Greenhouse Gas Emissions.[1]

c-e) Enbridge Gas does not have the required time to review the seven referenced studies for applicability to its service territory, its customers or other Enbridge Gas-specific parameters, nor to review the referenced studies to understand the manner in which assumptions are made and calculations are determined. Enbridge Gas therefore declines to produce the requested calculations.

f) When 1 m^3 of natural gas is combusted, 0.001874 tCO_2e emissions are released[2], while 1 m^3 of methane emitted to the atmosphere without combustion is equal to 0.016 tCO_2e. Enbridge Gas notes that starting in 2022, the Company has updated the emission factor used for combustion of natural gas to the factors in the National Inventory Report. Please see response at Exhibit I.4.2-ED-132, part c). Using the new factor, when 1 m^3 of natural gas is combusted, 0.001932 tCO_2e emissions are released. There is no change to the emissions impact of 1 m^3 of methane emitted without combustion.

g) The percentage figures in Table 1 are based on the 2022 Residential Single Family Natural Gas End Use Study and are applied to 3.8 million residential customers.

Table 1
Number of Residential Customers with Specified Natural Gas Applications

#	Natural Gas Application	Proportion	Approximate number of customers
1	Natural Gas Home Heating[3]	94%	3,572,000
2	Natural Gas Cooking[4]	31%	1,178,000
3	Natural Gas Water Heater (tank)[5]	72%	2,736,000
4	Natural Gas Water Heater (tankless)	11%	418,000
5	Natural Gas Fireplace	35%	1,330,000

[1] Ontario Ministry of the Environment and Climate Change. (2017, November). Guideline for Quantification, Reporting and Verification of Greenhouse Gas Emissions. Table 20-3 and Table 20-4. https://prod-environmental-registry.s3.amazonaws.com/2018-01/013-1457_d_Guide.pdf.
[2] Using the emission factor referenced for the calculation of 2021 Scope 3 emissions in Exhibit 1, Tab 10, Schedule 3, pages 2.

[4] Please see a more detailed breakdown of cooking equipment on page 17 of the 2022 REUS report.
[5] The tank and tankless proportions in this table are rounded and add up to the 82% for natural gas water heating referenced on page 13 of the 2022 REUS report.

h) Please see response at Exhibit I.1.10-GEC-7, Attachment 5.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 3, Page 3

Preamble:

"in November 2020, Enbridge announced corporate ESG targets, which included targets related to reducing GHG emissions from operations. This includes achieving net-zero emissions by 2050 and an interim target of a 35% reduction in GHG emission intensity by 2030 relative to a 2018 base year."

Question(s):

a) Do Enbridge's GHG emissions reductions targets include: (i) direct emissions, (ii) indirect emissions, and (iii) customer emissions? Please explain.

b) Please provide a table showing the Enbridge's GHG emissions from 2018 (historical) through to 2030 (targeted).

c) How many gas-fired compressors does Enbridge own in Ontario?

d) Approximately how many gas-fired compressors will Enbridge replace between now and 2028? Of those, approximately how many will be replaced with an electric compressor versus a gas compressor?

e) Please provide complete the following table:

Activities to Achieve 35% GHG Reduction by 2030			
Activity	GHG reduction (tCO2e)	Forecast net incremental cost	Start and end date
Activity 1			
…			
Activity n			
Total of activities			
Total GHG reductions needed to meet 35% goal			

Response:

a) Please see Exhibit 1, Tab 10, Schedule 3, page 3, paragraph 8. Enbridge's corporate ESG targets are focused on scope 1 (direct GHG emissions) and scope 2 (electricity indirect GHG emissions) emissions. To date, other indirect GHG emissions, including customer emissions are not included in Enbridge's corporate ESG targets.

b) Please see Attachment 1, which provides Enbridge Gas's historical and forecasted emissions through 2030.

c) Please see Exhibit 2, Tab 6, Schedule 2, Page 179 of 288, Section 5.3.3 Storage and Transmission Asset Inventory, Table 5.3.3-1, which indicates a total of 53 gas-fired compressors in Ontario (14 in EGD rate zone, 39 in Union rate zones)

d) Enbridge Gas expects to replace nine compressors between now and 2028.

Seven of the nine compressors expected to be replaced are compressors at the Corunna Compressor Station and will be replaced by the Dawn to Corunna Pipeline project. Enbridge will not be replacing any of these seven existing compressors with electric compressors per the Dawn to Corunna Replacement Project Decision[1], which states

> "While electric compression may hold promise in future applications, the OEB finds that the orderly removal of the Corunna Compressor Station compressors in question and replacing the compression with existing capacity at Dawn to be the most cost effective approach to avoid potential reliability issues under these circumstances".

Two additional compressors have been identified for Life Cycle Replacement and electric compressors will be reviewed in the alternatives analysis giving due consideration to electrical grid reliability considerations and associated requirements and cost for gas fired standby compression:

i. Please see, Exhibit 2, Tab 6, Schedule 2, page 189 of 288, in Section 5.3.5.4.1 Compression Modernization, Waubuno Compression Life Cycle, and Exhibit 2, Tab 6, Schedule 2, Appendix A, page 8 of 59, Waubuno Compression Life Cycle

ii. Please see Exhibit 2, Tab 6, Schedule 2, page 189 of 288, in Section 5.3.5.4.1 Compression Modernization, Dawn C Compression Life Cycle, and Exhibit 2, Tab 6, Schedule 2, Appendix A, page 4 of 59, Dawn C Compression Life Cycle.

[1] EB-2022-0086, Decision and Order, November 3, 2022.

e) The interim target of a 35% reduction in GHG emission intensity by 2030 relative to a 2018 baseline is an Enbridge Inc. target. Please see Exhibit 1, Tab 10, Schedule 8, Table 1 for a list of Scope 1 and 2 emissions reduction opportunities already being undertaken as part of Enbridge Gas's Scope 1 and 2 emissions reduction plan to support the achievement of Enbridge Inc.'s ESG goals. There are no incremental costs to achieve these GHG reductions. Please see Exhibit 1, Tab 10, Schedule 8, Table 2 for a list of potential emission reduction opportunities which have undergone an initial economic analysis to determine estimated emissions reductions and net present value. Please note Enbridge Gas has identified an error in Table 1 of Exhibit 1, Tab 10, Schedule 8. The Forecasted Project Emissions Reductions for the Direct Inspection and Maintenance Program/Leak Detection and Repair (LDAR) Project should be 8,200 tCO2e, not 118,200 tCO2e.

Enbridge Gas Emissions Outlook

Line No.	Particulars	2018 Act	2019 Act	2020 Act	2021 Act	2022 Est	2023 F	2024 F	2025 F	2026 F	2027 F	2028 F	2029 F	2030 F
1	Emissions (tCO2e)	871,154	957,772	832,646	889,680	917,243	879,925	879,956	876,760	879,009	879,922	880,611	881,137	878,121

Note: 2022 audited emissions are not yet available

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 4, Page 17

Preamble:

"There is potential that climate change legislation, such as municipal or provincial plans to phase out the use of natural gas, could have a life-shortening effect on Enbridge Gas's system. However, there is also the possibility that service lives could be lengthened or maintained if low-carbon fuels, such as hydrogen and **RNG**, are determined to be viable sustainable alternatives to natural gas."

Question(s):

a) Please file a copy of all studies estimating the RNG potential in Ontario that Enbridge is aware of.

b) Please summarize the conclusions of RNG potential studies referred to in (a) regarding Ontario's RNG potential in the following table:

Ontario's RNG Potential (m3) – Comparison of Report Conclusions					
Feedstock	**Report 1 (potential year)[1]**	**Report 3 (potential year)**	**Report 3 (potential year)**	**…**	**Report n (potential year)**

c) Please file a copy of all studies estimating the RNG cost that would be applicable to Ontario that Enbridge is aware of.

d) Please summarize the conclusions of RNG potential studies referred to in (c) regarding Ontario's RNG potential in the following table:

[1] i.e. the year in which the stated potential is described in the report as being available.

RNG Cost in Ontario ($/m3) – Comparison of Report Conclusions					
Feedstock	**Report 1 (year)**[2]	**Report 3 (year)**	**Report 3 (year)**	**…**	**Report n (year)**
Feedstock 1					
…					
Feedstock n					
Weighted average					

Response:

a-b) Enbridge Gas is aware of three studies outlining supply potential for RNG in Ontario. Providing a comparison of supply potential by feedstock type and year is not feasible within the response timeframe; however, Enbridge Gas has provided references for each study in the list below. Enbridge Gas is also providing references to RNG potential studies carried out in other jurisdictions.

1. *RNG Potential Studies with Ontario Estimates*

    i. Renewable Natural Gas (Biomethane) Feedstock Potential in Canada: Torchlight Bioresources.[3] (see Figure 31)

    ii. Potential Production of Renewable Natural Gas from Ontario Wastes[4]

    iii. Benefits to the Economy, Environment and Energy (Canadian Biogas Association study as referenced in the Torchlight study)[5]

2. *RNG Potential Studies from Other Jurisdictions*

    i. Renewable Sources of Natural Gas: Supply and Emissions Reductions Assessment: American Gas Foundations[6] (see Figures 1 and 2)

[2] i.e. The year that the cost estimate relates to if it is not a current-year estimate.
[3] Renewable Natural Gas (Biomethane) Feedstock Potential in Canada, 2020, p.56, https://www.enbridge.com/~/media/Enb/Documents/Media%20Center/RNG-Canadian-Feedstock-Potential-2020%20(1).pdf
[4] EB-20211-0242, Exhibit B, Tab 1, Appendix 1, p.vi.
[5] Canadian Biogas Study: Benefits to the Economy, Environment and Energy, December 2013, https://www.build-a-biogas-plant.com/PDF/Canadian_Biogas_Study_Technical_Document_Dec_2013.pdf
[6] Renewable Sources of Natura Gas: Supply and Emissions Reduction Assessment, December 2019, p.3, https://gasfoundation.org/wp-content/uploads/2019/12/AGF-2019-RNG-Study-Full-Report-FINAL-12-18-19.pdf

ii. Potential Production of Methane from Canadian Wastes[7]

iii. Resource Supply Potential for Renewable Natural Gas in BC[8]

iv. Renewable natural gas (RNG) production: Key driver in the energy transition and economic development for Quebec regions[9]

c-d) Enbridge Gas is not aware of any studies specific to RNG costs, although production costs are available in the studies provided at part a). The cost of RNG supply for Ontario would depend on the quantity and price of supply purchased and cannot be estimated by Enbridge Gas.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, p. 14

Preamble:

"41. Regardless of the pathway chosen to achieve net-zero, the study found that energy efficiency, RNG, hydrogen and natural gas with CCUS are required, and net-zero cannot be achieved without these actions."

Question(s):

These questions are for Guidehouse:

a) Does the Guidehouse report study find that CCUS is required for Ontario to reach net-zero by 2050? If yes, please justify that conclusion and explain how it was reached in light of the fact that Guidehouse did not study a scenario that excludes CCUS.

b) Does the Guidehouse report find that significant use of RNG and hydrogen for residential heating is required for Ontario to reach net-zero by 2050? If yes, please justify that conclusion and explain how it was reached in light of the fact that Guidehouse did not study a scenario that is specific to this.

c) Does the Guidehouse report find that transportation of RNG and hydrogen through major pipelines required for Ontario to reach net-zero by 2050 (versus on-site electrolysis/storage or local pipelines)? If yes, please justify that conclusion and explain how it was reached in light of the fact that Guidehouse did not explicitly study this.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a-c) These questions pertain to the scenarios that were defined and explored in the *Pathways to Net Zero Emissions for Ontario* Study. The questions ask whether the technologies of CCUS, RNG and hydrogen heating, and RNG and hydrogen pipeline transportation are required for Ontario to reach net-zero by 2050. Further, the questions ask how Guidehouse could conclude that any of these technologies is required if Guidehouse did not test scenarios where these technologies were absent.

The P2NZ Study compared and contrasted two plausible scenarios under which Ontario can achieve net-zero emissions by 2050, given the policies and regulations that are in place or likely to emerge and given recent trends in technology development and adoption. Guidehouse judged it plausible that, in 2050, Ontario's heavy transportation and industrial sectors will still use some carbon-based fuels and that some building owners in Ontario will want to maintain fuel-fired heating systems. The *Pathways* analysis answered the questions, "What would need to happen for scenarios with these characteristics to occur? And what would it cost?" The *Pathways* study shows that, for the two scenarios examined (i.e., the Diversified scenario and the Electrification scenario), the least-cost method of supplying future energy demand involves the use of CCUS, RNG, and hydrogen transmission technologies.

The P2NZ Study does not find that CCUS, RNG and hydrogen heating, and RNG and hydrogen pipeline transportation are required for Ontario to reach net-zero by 2050 in *every conceivable scenario*. There may exist scenarios outside the scope of the P2NZ Study that achieve net-zero emissions in 2050 without the use of CCS, RNG, and hydrogen technologies. However, the purpose of the *Pathways* analysis was not to analyze every potential combination of technologies that could yield net-zero emissions by 2050.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 1, p. 21

Preamble:

Exhibit 13 – Emission Factors

Fuel	Emission Factor (gramsCO2e/m3)	Notes/Assumptions
Natural Gas	1,899	• Calculated using a 100-year AR4 GWP values of 25 and 298 for CH4 and NO2 respectively.[8]
Natural Gas with Carbon Capture	389	• PG Analysis, using the 2020 NIR emission factors for CH4 and NO2 and assuming an 80% capture rate of CO2.
Renewable Natural Gas	11	• Enbridge Gas analysis, using the 2020 NIR emissions factors for CH4 and NO2 and assuming 100% of CO2 is biogenic.
Hydrogen	0	• Hydrogen does not produce combustion emissions.

Question(s):

a) Please provide the basis for the 80% capture rate for CCS. Please provide any underlying studies or reports.

b) Please explain the emissions factor for RNG. What portion of those emissions are fugitive emissions.

Response:

The following response was provided by Posterity Group:

a) The 80% capture rate was conservatively assumed based on literature research:

- At an industry sector level, CCS capture efficiency of 90% is commonly used in literature and feasibility studies regardless of technology type, location and fuel type.[1, 2]
- Sector specific references were also provided by Enbridge to further inform the assumption[3, 4, 5, 6, 7].
- Capture efficiency refers to the efficiency of the CCS 'unit' itself and does not represent the percentage of emissions captured via CCS vs. total facility emissions.

b) The Government of Canada's 2020 National Inventory Report (1990-2018)[8] provides end-use combustion emission factors for CH4 (0.037 g/m3) and N2O (0.035 g/m3). Because we are assuming 100% of CO2 is biogenic, only CH4 and N2O are contributing to GHG emissions. The same report references IPCC assumptions for CH4 and N2O global warming potentials (100-year AR4 GWP values of 25 and 298 for CH4 and N2O respectively). To calculate the total end-use combustion emission factor for RNG, we calculated gramsCO2e/m3 for CH4 and N2O:

- CH4 (gCO2e/m3) = 0.037 gCH4/m3 x 25 GWP = 0.925 gCO2e/m3
- N2O (gCO2e/m3) = 0.035 gN20/m3 x 298 GWP = 10.43 gCO2e/m3
- Total = 11.355 gCO2e/m3

---

Because our analysis reported end-use combustion emissions (not lifecycle emissions), the RNG factor does not include fugitive emissions

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 1, p. 29

Preamble:

Critical Driver	Setting that deviates the most from the Reference Case assumption	Impact on Annual Volume by 2038	Impact on Peak	Impact on GHG Emissions by 2038
Carbon price	Max: $282/tonne.	22% decline	22% decline in hourly and daily peak	22% decline
Natural Gas Price	Max: 400% higher than current natural gas prices.	30% decline	~27% decline in hourly and daily peak	30% decline

Question(s):

a) Are the above two drivers considered to be additive? For instance, if both occur, would annual demand decline by 52%?

b) Please provide all calculations and assumptions underlying the assumption of a 30% decline in annual demand resulting from a 400% increase in gas prices. What does this amount to in terms of the differential between the price of home heating by gas versus electric heat pumps (lifetime $ difference and % difference)? At the time of the report, what was considered the “baseline” current price ($/m^3)?

Response:

The following response was provided by Posterity Group:

a) Yes, the two drivers are considered to be additive. Yes, we would expect a decline of 52%.

b)

i. *Please provide all calculations and assumptions underlying the assumption of a 30% decline in annual demand resulting from a 400% increase in gas prices.*

First, as a point of clarification, the gas commodity price was increased to 400% of the reference value (four times as high), rather than applying a 400% increase (five times as high). The table in the report did not make this clear.

The calculation of price-driven demand decline is different for each sector. In the residential sector, the calculations proceed as follows:

- Reference gas price in 2038 (in ¢/m^3) is estimated to be 15.90 for commodity, 13.37 for carbon, and 28.68 for other charges, for a total of 57.96 ¢/m^3.
- Multiplying the gas price by four results in 63.61 for commodity, 13.37 for carbon, and 28.68 for other charges, for a total of 105.67 ¢/m^3.
- This represents an increase of 82%, but PG uses a mid-point elasticity calculation, as explained in Section 3.1.2 of the report (please see Exhibit 1, Tab 10, Schedule 5, Attachment 1, pages 19-20). The percentage increase is therefore calculated relative to the average of the reference price and the new price. (105.67 – 57.96) / (Average (57.96, 105.67) – 1 = 58%
- Using a long-term elasticity of 0.38, the instantaneous response to this price increase would be -22%. To use the midpoint elasticity approach, PG applies an adjustment to this number, using the equation shown in Section 3.1.2. The calculation is as follows: (22% - 2) / (-22% - 2) – 1 = -19.9%
- The residential sector accounts for approximately 40% of total load.

In the commercial sector, the calculations proceed as follows:

- Reference gas price in 2038 is estimated to be 15.90 for commodity, 13.37 for carbon, and 19.15 for other charges, for a total of 48.43 ¢/m^3.
- Multiplying the gas price by four results in 63.61 for commodity, 13.37 for carbon, and 19.15 for other charges, for a total of 96.14 ¢/m^3.
- This represents an increase of 99%. Using the same mid-point elasticity approach as above, the percentage increase is therefore calculated relative to the average of the reference price and the new price. (96.14 – 48.43) / (Average (48.43, 96.14) – 1 = 66%
- Using a long-term elasticity of 0.35, the instantaneous response to this price increase would be -23%. To use the midpoint elasticity approach, PG applies the same adjustment approach as above: (23% - 2) / (-23% - 2) – 1 = -20.7%

- The commercial sector accounts for approximately 19% of total load.

In the industrial sector, the calculations proceed as follows:

- Reference gas price in 2038 is estimated to be 15.90 for commodity, 4.03 for carbon, and 17.03 for other charges, for a total of 36.96 ¢/m^3.
- Multiplying the gas price by four results in 63.61 for commodity, 4.03 for carbon, and 17.03 for other charges, for a total of 84.67 ¢/m^3.
- This represents an increase of 129%. Using the same mid-point elasticity approach as above, the percentage increase is therefore calculated relative to the average of the reference price and the new price. (84.67 – 36.96) / (Average (36.96, 84.67) – 1 = 78%
- Using a long-term elasticity of 0.7, the instantaneous response to this price increase would be -55%. To use the midpoint elasticity approach, PG applies the same adjustment approach as above: (55% - 2) / (-55% - 2) – 1 = -43.1%
- The industrial sector accounts for approximately 41% of total load.

Weighting the reduction for each of the three sectors by their share of the overall load results in the following calculation: (20% x 40%) + (21% x 19%) + (43% x 41%) = 30%.

ii. *<u>What does this amount to in terms of the differential between the price of home heating by gas versus electric heat pumps (lifetime $ difference and % difference)?</u>*

Posterity Group did not conduct a comparison of the cost of different home heating methods as part of this study. The additional research, analysis, and modelling required to answer this question cannot be completed within the IR timeframe.

iii. *<u>At the time of the report, what was considered the “baseline” current price ($/m3)?</u>*

The baseline (commodity) gas price in the base year of the study (2019) was 11.75 ¢/m^3.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 1, p. 29

Question(s):

a) What would the impact be on annual and peak gas demand if, starting in 2022, the cost-effectiveness of fully electrified heating/cooling with a heat pump was $11,071 cheaper than traditional gas heating (gas furnace, gas water heater, and AC) over the 15-year equipment lifetime? Please assume that the cost-effectiveness differential increases as the carbon price increases according to announced federal prices. Please provide a response on a best efforts basis. In answering the question, Posterity Group need not agree with any of the premises.

Response:

a) The following response was provided by Posterity Group:

Responding to this question would require modeling a new Demand Side Management (DSM) measure not currently included in the Navigator model constructed for this project. There is insufficient time to make that alteration to the model within the IR timeframe.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 1, p. 40

Preamble:

Exhibit 26 – Scenario Narratives

Scenario Title:	Reference Case	Steady Progress	Diversified Portfolio	Electricity Centric

Question(s):

a) For each scenario, please provide relative cost-effectiveness of residential space conditioning and cooling from a customer perspective as between (i) gas equipment and a traditional air conditioner, (ii) hybrid heating, and (iii) a house fully electrified with heat pumps (and not required to pay for gas distribution charges).

b) Please confirm that the relative cost-effectiveness of the above options will impact gas demand.

c) Page 40 states: “The ETSA project team built off the scenario narratives envisioned by Enbridge Gas prior to beginning the project to draft scenario narratives.” Please provide a copy of what Enbridge provided.

d) This question is for Enbridge: How did Enbridge develop the scenario narratives provided to Posterity Group? Please provide any reports or memos in relation the development of those narratives.

e) Please assess the relative probability of the future being more similar to the reference case, study progress, diversified portfolio, or electricity centric scenarios.

Response:

a-b) The following response was provided by Posterity Group:

The Navigator model can conduct cost-effectiveness tests on individual measures, but is not designed to produce the kind of cost-effectiveness calculation contemplated in this question. Also, developing costs estimates were not part of the study scope.

c) The following response was provided by Posterity Group:

Scenario narratives were developed via discussions with the Enbridge Gas team. Enbridge Gas did not provide a document describing what the organization envisioned.

d) As noted by Posterity in part c), scenario narratives were developed via discussions between Enbridge Gas and Posterity. Enbridge Gas and Posterity worked collaboratively and through an iterative process to develop the scenarios and critical driver settings. The process describing the development of scenario narratives and the final scenario narratives is provided in Exhibit 1, Tab 10, Schedule 5, Attachment 1, pages 39 to 41.

e) The following response was provided by Posterity Group:

We did not assign any probabilities to any of the scenarios. We view the multi-scenario modeling approach as a way to mitigate risk. We advise our utility clients to develop plans that are robust in the face of a range of plausible scenarios, particularly in cases where future policy, prices, and economic variables are uncertain.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 1, 40

Preamble:

Exhibit 15 – Sensitivity of Annual Volumes, Peak and GHG Emissions by Critical Driver

Critical Driver	Setting that deviates the most from the Reference Case assumption	Impact on Annual Volume by 2038	Impact on Peak	Impact on GHG Emissions by 2038
Carbon price	Max: $282/tonne.	22% decline	22% decline in hourly and daily peak	22% decline
Natural Gas Price	Max: 400% higher than current natural gas prices.	30% decline	~27% decline in hourly and daily peak	30% decline
Non-Price Driven fuel-switching (gas to electricity)	Max: Beginning in 2025, no new gas connections, and space and water heating equipment at existing accounts must be replaced with electric alternatives at the equipment's natural end of life.	42% decline	Hourly peak: 50% decline Daily peak: 55% decline	42% decline

Question(s):

a) Please confirm whether any of the scenarios studied include any of the three drivers noted above. If not, why not. Please explain in detail.

b) What is the likelihood that one of the three "settings" above would come to pass? Please provide the likelihood for each individually, and the likelihood that any one of them would come to pass. Please justify the answer with specific details.

Response:

The following response was provided by Posterity Group:

a) Exhibit 27 in Section 6 of the report provides the details of the settings for each of the critical drivers in each scenario (please see Exhibit 1, Tab 10, Schedule 5, Attachment 1, pages 42-43). None of the exact settings in the preamble to this IR were used in the modeled scenarios. The scenario settings provided in Exhibit 27 were based on the scenario narratives developed by the ETSA project team and finalized with input from internal and external stakeholders, as described in Section 6.2 of the report.

b) We have not attempted to assign probabilities to the likelihood that each setting would come to pass. We view the multi-scenario modeling approach as a way to mitigate risk. We advise our utility clients to develop plans that are robust in the face of a range of plausible scenarios, particularly in cases where future policy, prices, and economic variables are uncertain.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

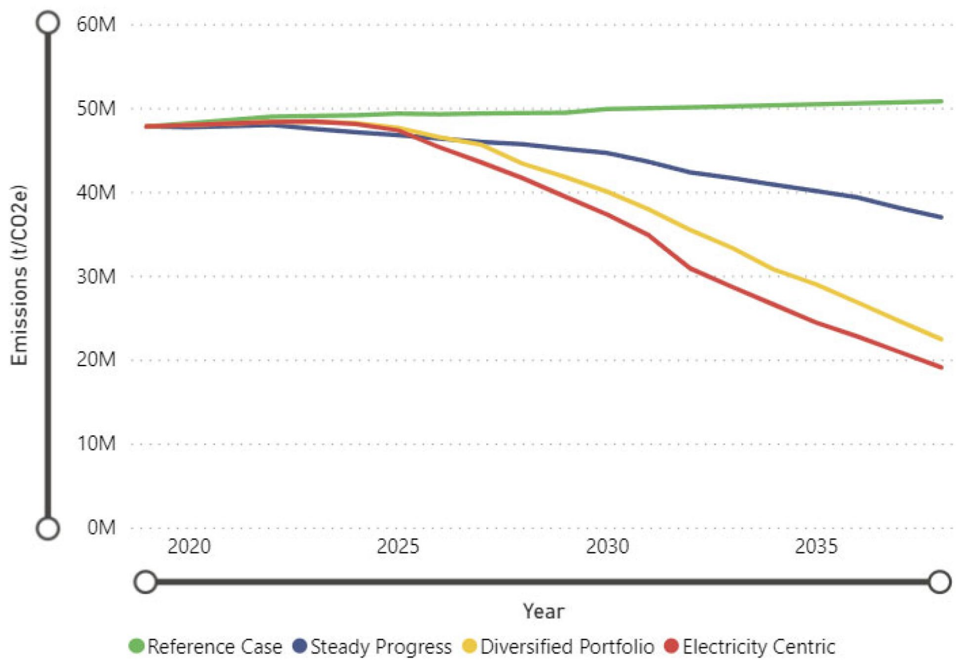
Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 1, p. 79

Preamble:

Exhibit 71 – Scenarios Comparison: GHG Emissions



Question(s):

a) Please reproduce the above figure including full lifecycle emissions, including upstream emissions (e.g. from fossil-fuel-based hydrogen, transmission methane leaks, etc.) and methane leaks from customer equipment. Please make and state your assumptions for those.

For upstream emissions from fossil-fuel-based hydrogen, please use the figures found in the following peer-reviewed report or justify a decision to use different figures: Robert W. Howarth and Mark Z. Jackson, "*How green is blue hydrogen?*" *Energy Science & Engineering*, 26 July 2021 (link).

For the emissions of unburned methane from customer equipment, please use the figures found in the following peer-reviewed report or justify a decision to use different figures: Zachary Merrin and Paul W. Francisco, *Unburned Methane Emissions from Residential Natural Gas Appliances* (link).

Response:

a) The following response was provided by Posterity Group:

Our analysis reported end-use combustion emissions (not lifecycle emissions). Undertaking new research, developing appropriate lifecycle emissions, and remodeling using lifecycle emissions cannot be completed within the IR timeframe.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 1

Preamble:

- *Electricity Centric Scenario:* The fuel shares for residential and commercial space heating is 27% and 24% respectively by 2038 (approximately 800,000 customers). As the natural gas system is contracting, investment into adding new hydrogen loops (additional customers) is not made. Blend percent is increased from 2% to 10% in 2035 for customers on existing hydrogen loop (21,000 customers).

Exhibit 101 – Hydrogen Blend in the Steady Progress and All Electric Scenarios

	Steady Progress Scenario (# customers receiving 10% H2)	All Electric Scenario (#customers receiving 10% H2)
2035	200,000 customers	18,760 customers
2038	800,000 customers	20,770 customers

Question(s):

a) Why does Posterity Group assume that customers were use 10% hydrogen? Does Posterity believe this would be cheaper than customers converting to electric heating? If yes, why?

b) What is the “existing hydrogen loop” referred to above?

c) What are the RNG assumptions for the steady state and all electric scenarios?

Response:

The following response was provided by Posterity Group:

a) Posterity Group modeled the scenarios developed by the ETSA project team and finalized with input from the internal and external stakeholders. The inputs for the hydrogen critical driver included an assumption that blend percent could be increased to 10% in 2035. We did not conduct an analysis of which option would be less expensive for the customer

b) The existing hydrogen loop refers to the customers served by Phase 1 of Enbridge Gas's Low Carbon Energy Project.

c) As detailed in Exhibit 27 in Section 6 of the report (please see Exhibit 1, Tab 10, Schedule 5, Attachment 1, page 42), the Steady Progress scenario includes the following assumptions regarding RNG:

- Clean Fuel Regulation (CFR) directs RNG and H2 to transportation
- CFR provides modest incentive for CCS, RNG & H2
- H2 cost competitive with natural gas in 2035, RNG is cost competitive in 2030

The Electricity Centric scenario includes the following assumptions regarding RNG:

- CFR remains, like Steady Progress scenario
- H2 cost competitive with natural gas in 2035, RNG is cost competitive in 2030

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 1, p. 113

Question(s):

a) According to Posterity Group, what is the feasible RNG potential in Ontario (PJ/d)? Please justify the answer with reference to RNG potential studies. Please compare the answer to the RNG potential found by the OEB in its Marginal Abatement Cost Curve study.

b) Please reproduce the above, inserting amounts in terms of PJ/d.

c) If RNG potential in Ontario is 40 PJ/d, how would that impact the peak gas volume results of the various scenarios.

Response:

The following response was provided by Posterity Group:

a-b) Posterity Group did not conduct an analysis of the feasible RNG potential in Ontario.

Within the IR timeframe there is insufficient time for Posterity Group to undertake an analysis of the feasible RNG potential in Ontario and compare these amounts to the OEB's Marginal Abatement Cost Curve study.

We interpret the intent of ED-23 part b) is to request that we reproduce the first row of Exhibit 102 on Exhibit 1, Tab 10, Schedule 5, Attachment 1, page 113 in terms of PJs of RNG. Below we present the original first-row and a new row added at the bottom showing annual PJs of RNG for the years 2025, 2030, 2035 and 2038. We are unable to comment on what this would look like in terms of daily or peak production capacity.

	2025	2030	2035	2038
RNG (% of total energy)	0.5% (starts)	5%	10%	13%
Annual RNG demand (PJ)	5	48	87	105

c) Since RNG is considered interchangeable with natural gas, with its comparable energy content and seasonal storage abilities, in our modelled scenarios we assume substitution of natural gas with RNG will not impact peak gaseous volume.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2

Question(s):

a) Please provide a list of the authors of the Guidehouse report and copies of their CVs.

b) Please provide a table showing the decarbonization pathways studies that the report authors have worked on, a description of their role(s) in said studies, and links to (or copies of) those studies.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Authors of the *Pathways to Net Zero Emissions for Ontario* Study include Nicola Charles, Decker Ringo, Alvaro Lara, Marissa Moultak, David Mavins, and Andrea Roszell. Decker Ringo and Andrea Rozsell's CVs are provided at Exhibit 1, Tab 1, Schedule 6, pages 77 to 83. Copies of the rest of the authors CVs are provided in Attachment 1.

b) Table 1 shows the decarbonization pathways studies that the report authors have worked on and a description of their role(s) in said studies. The table provides footnotes with links to publicly available studies.

Table 1

Contributing Authors & Prior Reports

Author	Prior Report (s)	Role
Nicola Charles	National Grid NY[1]	Lead model developer and analyst for multiple decarbonization pathways studies.
Decker Ringo	NFGDC[2], National Grid NY[1]	Led model development, supporting input data collection and forecasting, assessment of outputs, and reporting.
Alvaro Lara	Pan-EU[3], National Grid UK (publication pending), GRTGaz[4], Nordion[5]	Lead analyst and modelling advisor on a variety of decarbonization pathways projects.
Marissa Moultak	Pan-EU[2], National Grid UK (publication pending), GRTGaz[3], Nordion	Analyst and modeler on decarbonization projects, applying in depth energy system optimization modeling to help inform policy.
David Mavins		No prior pathways experience with Guidehouse.
Andrea Roszell	FortisBC Pathways[6]	Acted as project manager for the development of pathways to meet provincial GHG reduction targets.

Alvaro Lara

Managing Consultant

alara@guidehouse.com
Abu Dhabi, UAE
Direct: +971 50 194 5847

Professional Summary

Alvaro Lara is a Managing Consultant in Guidehouse's Energy, Sustainability and Infrastructure practice with 7+ years of experience supporting electric and gas companies, government, and regulators across North America, Europe and the Middle East. His expertise includes electricity and gas integrated system modelling, energy system decarbonization pathways, hydrogen system planning, grid modernization and smart grid investment plans, rate-setting, regulation and policy. Most recently, Alvaro has supported electricity and gas utilities in Canada, the UK and the Nordics in the assessment of integrated electricity and hydrogen infrastructure planning.

Alvaro's experience also includes the electric mobility space, as an Operations Manager (Clean Air & Electrification) at Uber, where he led the implementation of Uber's Clean Air Plan strategy in London. Alvaro holds a BEng. in Mechanical Engineering from the University of Toronto (Canada) and an MSc in Climate Change, Management and Finance at Imperial College Business School (UK).

Areas of Expertise

- **Electricity and Gas System Modelling and Decarbonization Pathways:** Developed decarbonization pathways and high-level infrastructure plans for gas transmission and distribution infrastructure companies supporting their transition from natural gas to low-carbon and renewable gas (biomethane, hydrogen).
- **Business Cases for Grid Modernization & Smart Grid Investments:** Conducted multiple detailed costs-benefit analyses (CBA) of grid modernization investments, electric vehicles, microgrids, and other emerging technologies for distribution utilities, governments, and project developers.
- **Electricity Rate Setting Regulation and Policy:** Support energy regulator in developing forecast of wholesale market prices and regulated electricity rates. Assess costs and risks associated with a policy alternatives based on detail review of supply and demand conditions and conduct statistical and probabilistic analyses to support strategic advice.

Professional Experience

Energy System Decarbonization Pathways

- **UK Electricity and Gas Transmission Outlooks to 2050, Modeling Lead, National Grid GB. (2022).** Assessment of electricity and gas (natural gas and hydrogen) transmission infrastructure pathways from 2025 to 2050. Analysis models an integrated electricity, hydrogen and methane system covering a geographic scope made up of eleven subregions with GB, seven offshore electricity / hydrogen production nodes and three neighboring regions (Ireland, Western Europe and Northern Europe). Analysis will support National Grid's vision of evolving its currently siloed electricity and gas system planning towards an integrate "whole system" planning approach.

Guidehouse

Alvaro Lara

Managing Consultant

- **Decarbonization Pathways for Ontario's Energy System, Modelling Advisor, Enbridge Gas Inc. (2021-22).** Assessment of various decarbonization pathways for Ontario's electricity and gas systems towards 2050. Analysis aimed at identifying a least-cost, net-zero energy system, as well as identifying required investments in electricity and gas supply and infrastructure associated with those visions of Ontario's energy systems. Final report will support Enbridge's strategic positioning of the role played by low carbon and renewable gas in achieving net-zero emission in Ontario.
- **Gas Decarbonisation Pathways, Project Manager, Northern Ireland Gas TSOs & DNOs (2021).** Development of gas decarbonisation pathway for gas transmission and distribution companies in Northern Ireland (NI). Analysis serves a foundation for NI gas networks' decarbonisation plans and investments over their next regulatory period (2022-2026), as well as feeding into the NI Gov's energy strategy, part of the UK's Net Zero 2050 strategy.
- **Gas Decarbonisation Infrastructure Pathways, Lead Analyst, Nordic Gas Infrastructure Companies (Nordion Energi & Gas DSOs) (2021).** Lead analyst developing decarbonisation pathways for the Swedish energy system to understand the buildout of electricity, hydrogen and methane supply capacity, and associated transmission infrastructure within Swedish regions and with neighboring regions. Gas infrastructure and investment plans developed based on two main demand scenario and various sensitivities.
- **Decarbonisation of GB's Gas Networks, Modelling Lead, Energy Networks Association (2019).** Lead modelling of 2050 net-zero vision for GB's energy system, focusing on decarbonisation pathways from 2020 to 2050 for the gas networks, and the development of hydrogen and biomethane gas infrastructure and the electrification of heat.

Business Cases for Grid Modernization & Smart Grid Investments

- **Smart Grid Strategy and Roadmap, Workstream Lead, Middle East Utility (DEWA) (2018).** Lead development of cost-benefit analysis of smart grid portfolio including investments in Advanced Metering Infrastructure (AMI), Distribution Automation, Transmission Automation, Asset Management, Customer Engagement, among other areas. Supported development of AMI strategy roadmap for future functionalities; AMI customer-fingerprinting, energy services cross-selling, and external-data insights.
- **Customer-DER Distributed-Intelligence Analysis, Economic Analysis Lead, US Utility (Duke Energy) (2017).** Lead economic assessment of customer-sited distributed energy resources (DER) – predominantly distributed-solar PV and storage – on US Midwest GT&D utility's network. Analysis identified prioritization schedule of utility investment and network feeders optimal for customer DER adoption. Duke Energy – Cost-benefit analysis of a collection of distributed intelligence technologies focused on the transformation of the distribution grid driven by the adoption DER resources (solar PV and storage). Analysis based on the characteristics of a selection of representative feeders, low/high DER forecasts, microgrid forecasts, declining technology costs, reliability improvements, and improved utility O&M.

Guidehouse

Alvaro Lara

Managing Consultant

- **Distribution-Network Efficiency Potential Assessment, Workstream Lead, Government (Ontario Ministry of Energy) (2017).** Lead cost-benefit analysis of Volt/VAR optimization (VVO) investments in Ontario's distribution networks. Developed CBA framework for analysis and implemented feeder-level analysis using 15 prototypical feeders. Results were extrapolated to Ontario's 10,000 feeders. Analysis led to VVO becoming eligible for regulator funding and inclusion into utility DSM strategies
- **Customer Time Varying Rates & AMI Grid Modernisation Plan, Lead Analyst, US Utility (Eversource Energy) (2015)**. Lead cost-benefit analysis of grid modernization in support of Eversource's Short Term Investment Plan (STIP) and regulatory filing requirement in Massachusetts. Grid Modernization plan included assessment of new opt-in/opt-out customer tariff rates, and investments in overhead and underground distribution automation and fault-detection. Results enabled utility to file grid modernization investment plan and to obtain regulatory approval.

Electricity Rate Setting Regulation and Policy

- **Customer Tariff Rate Setting Process, Project Manager, Canadian Energy Regulator (2015/17)**. Managed semi-annual assessment of Ontario's wholesale electricity market and lead update of regulated customer electricity rates. Developed alternative customer pricing structures for assessment and implementation by energy regulator. Ongoing support to Ontario's utility regulator in the development of a market price forecast for Ontario's wholesale electricity market and forecasting regulated electricity rates for electricity customers in the province.
- **Rate Impact Assessment from Customer Tariff Policy Scenarios, Lead Analyst Lead, Government (Ontario Ministry of Energy) (2016).** Analyzed the financial and electricity system impacts of incremental load additions on ratepayers, and current supply-demand conditions. Analysis lead to policy changes and development of expansion of rate tariff structures to large-load customers. Evaluated scenarios through risk assessment modelling, and develop recommendations based on workshops with the IESO, OEB, and large consumer stakeholder groups.
- **Distributed Generation Financial Impact, Lead Analyst, Toronto Hydro (2016)**. Develop financial model to quantify the historical financial impact of distributed generation (DG) on a Toronto Hydro's business operations. Forecasted future financial impact and developed recommendations to mitigate impact, recover revenue requirement, and promote DG growth

Professional Summary

David is a Consultant in the Energy, Sustainability & Infrastructure segment at Guidehouse's Toronto office. David is Interested mainly in projects involving utility strategy with respect to new technology and services, His broad knowledge and skills make him effective at understanding links between multiple disciplines.

David worked on a multidisciplinary team at a major Ontario utility, focusing on strategy, enterprise risk management, performance management, corporate disaster preparedness, and stakeholder management. His experience has given him a comprehensive understanding of how utilities think and act.

Areas of Expertise

- **Distributed Energy Resources:** Supports development of strategies for utilities to implement distributed energy resources
- **Electric Vehicles:** Supports development of strategies to increase adoption of electric vehicles
- **Energy Efficiency Program Assessment:** Analyzes data from past energy efficiency programs to determine efficacy of data collection and program execution
- **Energy Efficiency Regulations:** Models the hypothetical future effects of proposed Minimum Energy Performance Standards to determine the potential energy savings and impact on the market
- **Evaluation, Measurement, and Verification:** Evaluates data collected through energy efficiency programs to confirm whether reported savings are accurate

Professional Experience

Distributed Energy Resources

- **Alectra, Unregulated Business Strategy.** Assisted in the development of Alectra's unregulated business strategy by determining most promising potential product and service offerings.

Guidehouse

- **Canadian Electricity Association, Regulatory Waste Study.** Analyzed regulatory waste across the Canadian electricity sector and compared with innovative regulation in other jurisdictions. Provided recommendations on how to modify regulations to encourage deployment of non-traditional distribution infrastructure and projects.

Electric Vehicles

- **BC Hydro, Electric Vehicle Rate Design.** Analyzed rate structures and regulatory proceedings for electric vehicle charging from various utilities and jurisdictions to provide recommendations for BC Hydro's electric vehicle charging rate design.
- **Exelon, Fleet Electrification.** Built database of all known present and future electric vehicle offerings in the US to assist in development of a client's fleet electrification strategy.

Energy Efficiency Program Assessment

- **Energy Efficiency Alberta, Past Program Analysis.** Analyzed and aggregated historic data into dashboards to help an energy efficiency agency better understand its customer base and identify gaps in data collection.

Energy Efficiency Regulations

- **Natural Resources Canada, EnerGuide Labelling Study.** Collected and analyzed data on energy efficiency labelling compliance for large appliances at a variety of retailers across Canada.
- **Natural Resources Canada, Market Studies.** Characterized the current market and forecasted the future market and stock for refrigerators and freezers in Canada. Reviewed regulatory and voluntary requirements related to energy efficiency. Produced a report to help the federal government determine the efficacy, reasonableness, and potential impacts of proposed energy efficiency standards. Contributed to similar reports on pool pumps and air compressors.

Evaluation, Measurement, and Verification

- **Energy Efficiency Alberta, Evaluation, Measurement, and Verification.** Assisted in the savings validation of several residential and commercial energy efficiency programs.

Work History

- Consultant, Guidehouse
- Student, Strategy & Enterprise Risk Management, Toronto Hydro

Education

- BAS, Engineering Chemistry, Queen's University

Guidehouse

Marissa Moultak
Senior Consultant

mmoultak@guidehouse.com
Utrecht, Netherlands
Direct: +31 30 662 3007

Professional Summary

Marissa is a senior consultant in the energy, sustainability, and infrastructure practice. With more than four years of experience advising energy companies, governments, and corporations on various decarbonisation topics.

Specialised in energy system modelling, Marissa supports clients by leading model based analyses to provide data-driven recommendations on decarbonisation and renewable integration.

With a strong technical background in Chemical Engineering and a masters in Complex Systems Engineering and Management, Marissa addresses challenging technical questions to help drive the energy transition.

Areas of Expertise

- **Energy System Optimisation:** Performs in-depth integrated energy system optimisation modelling to help clients answer a wide variety of questions regarding the future decarbonised energy system**.**
- **Decarbonisation Pathways:** Advises companies and governments on decarbonisation strategies using energy system modeling.
- **Demand Forecasting:** Performs in-depth demand analyses to determine future hydrogen and electricity demand.

Professional Experience

Energy System Optimisation

- **Gas for Climate, Hydrogen Transmission Study.** Applied in-depth energy system optimisation modelling to determine the benefits of a Pan-European hydrogen transmission system. Contributed to a public report that provides data-driven insights into the benefits of a Pan-European hydrogen transmission system to help inform policy.
- **Eneco, Renewable Energy Investment Analysis.** Developed an energy system model paired with an investment model to help inform the client's future investments in renewable energy.

Decarbonisation Pathways

- **Mutal Energy, Northern Ireland Pathway to Net Zero.** Performed energy system optimisation modelling to help the clients explore decarbonisation pathways for low carbon and renewable gas supply and gas infrastructure. Conducted sensitivity analyses to help the clients understand the range of possible future outcomes and help inform their decarbonisation strategy.

Guidehouse

Marissa Moultak
Senior Consultant

Demand Forecasting

- **European Hydrogen Backbone, Hydrogen Supply and Demand Study**. Developed a model to forecast hydrogen demand across the European market. Contributed to a public study and webinar that analysed the future demand, supply, and transport of hydrogen to help inform the clients, industry, and policymakers about the future hydrogen market in Europe.

Work History

- Senior Consultant, Guidehouse
- Consultant, Guidehouse
- Fundamental Analysis Graduate Thesis Intern, Eneco
- Acquisition Committee & Project Team Member, IRPdelft & LM Wind Power
- Electric Vehicle Fellow, International Council on Clean Transportation (ICCT)
- Sustainable Mobility & Powertrain Engineering Intern, BMW Group Technology Office

Education

- Master of Science, Complex Systems Engineering & Management (Energy track), Delft University of Technology
- Bachelor of Science, Chemical Engineering, University of California, Berkeley
- Minor, Energy and Resources, University of California, Berkeley

Guidehouse

Nicola Charles

Senior Consultant

nicola.charles@guidehouse.com
Toronto, Canada
Direct: 416.777.2461

Professional Summary

Nicola is a Senior Consultant in the Data Analytics sub-practice of Guidehouse's Toronto Energy practice. Nicola provides modeling expertise and applies a range of cutting-edge techniques—including optimization, regression analyses, machine learning, geographic information systems (GIS), and econometrics—to challenges in the energy industry.

As the industry looks to meet emerging carbon emissions targets, Nicola helps chart the pathways there. Specializing in economy-wide decarbonization, she performs in-depth linear optimization techniques to determine how energy systems need to evolve to meet the demand of electrification at the least cost to society.

Through her evaluation of energy efficiency programs and modelling of achievable potential, Nicola supports the design of energy efficiency programs across North America. She has experience evaluating a variety of demand response programs including multi-family water heater programs, residential smart thermostat programs, and commercial and industrial direct load control programs. She completes this work through the advanced use of analytical tools such as Python and R and is well versed in handling large datasets through SQL.

Areas of Expertise

- **Low Carbon Pathways:** Advises clients on the cost-optimal pathways to achieve carbon emission reductions informed by in-depth optimization modeling around economy-wide decarbonization.
- **Econometric Impact Evaluation:** Performs detailed analysis of demand response and energy efficiency customer programs to determine robust impacts using statistical regression methods.
- **Energy Efficiency and Cost Effectiveness:** Uses a suite of analysis approaches including achievable potential modeling to inform energy efficiency program design.

Professional Experience

Low Carbon Pathways

- **Enbridge, Ontario Decarbonization Pathways Study.** Nicola led the modeling efforts to evaluate two different pathways to achieve net-zero carbon emissions by 2050 and their associated impacts for Ontario in terms of overall feasibility, energy system capacity, system reliability, GHG emission reductions, and cost.

  Using an integrated energy system model adapted to the characteristics of Ontario's gas and electricity networks, Guidehouse identified future investments in electricity, hydrogen, and methane supply and infrastructure needed for Ontario's energy system to support economy-wide decarbonization.

Nicola Charles

Senior Consultant

Econometric Impact Evaluation

- **Duke Energy, EnergyWise Demand Response Evaluation.** Nicola is the impact lead for the evaluation of Duke Energy Florida's EnergyWise Home residential demand response program. In the 2019 analysis, she estimated the ex post and ex ante impacts of a subset of participants to examine the discrepancies of utilizing whole-home Advanced Metering Infrastructure (AMI) data versus installed A/C logger data. Her research showed that there is no statistically significant difference between the two methods, which allowed Duke Energy to leverage their investments in AMI and forgo the more costly deployment of device loggers for future demand response evaluations.

- **EmPOWER, Smart Thermostat Evaluation.** Nicola was part of the core analysis team working to determine the energy savings resulting from smart thermostat installations across five different utilities in Maryland. With the efficient use of regression techniques applied to cloud-hosted data, the team was able to estimate the effects of thermostats on residential energy loads across the study period. The result of this study was a robust savings estimate to be used for program planning and design.

- **Newfoundland Power, Thermostat Evaluation.** Nicola led the evaluation of a thermostat rebate program in Newfoundland and Labrador. The result of this study was a locally appropriate and program specific energy savings rate for a program that has been in operation for over 10 years. Going forward, the utilities can use this value to evaluate further investments in thermostat energy efficiency in the province.

- **PGE, Demand Response Evaluation.** Nicola has led the analysis for the evaluation of various demand response customer programs and pilots run by PGE from 2018 through 2022. Through her evaluation of their medium and large commercial customer pilot, she was able to support the pilot's transition to full demand response program. In addition to this, Nicola evaluated the commercial smart thermostat pilot and helped establish key cost-effectiveness metrics for the pilot. She also evaluated their multi-family water heater demand response program and provided key insights from equipment telemetry data to more efficiently access devices.

Energy Efficiency and Cost Effectiveness

- **IESO and OEB, 2019 Achievable Potential Study.** Characterized over 250 residential and commercial energy efficiency and fuel switching measures at very detailed levels of granularity across the study's entire jurisdiction. Led model QC at the measure level for technical potential. Led modeling efforts for 2 achievable potential scenarios and developed multiple tools to tailor results to specific client needs. Assisted in model optimization updates and sensitivity analysis. The results of this study directly inform program design and planning in Ontario today.

Nicola Charles

Senior Consultant

- **IESO, Cost Effectiveness Tool.** Nicola created an efficient cost effectiveness tool in Python which simulates the energy benefits, GHG emissions, and total budget spend of energy efficiency measure inputs. This tool helps facilitate energy efficiency program design in Ontario.

- **Duke Energy, Multi-Family Energy Efficiency Program EM&V Services**. Nicola led the analysis for the lighting logger study of multi-family dwellings across various Duke Energy Carolinas jurisdictions to measure the typical operating hours for program LEDs. The lighting logger data was extrapolated to create accurate estimates of annual hours of use by space type and lamp type. These program-specific estimates are now used to support energy efficiency program design regarding LEDs.

- **Energy Efficiency Alberta, eTRM**. Helped create an adaptive electronic TRM. Scripted algorithms to create interactive tools for computing the technical potential of each energy efficiency measure tailored to user inputs and verified measure validity.

- **BrightWind, Predictive Analytics for Wind Energy**. Built a neural network pipeline in Python to predict the power output of every windfarm in Ireland using weather predictions. Expanded on this by developing empirical learning models based on Markovian probabilities to predict power output based on historical power data.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

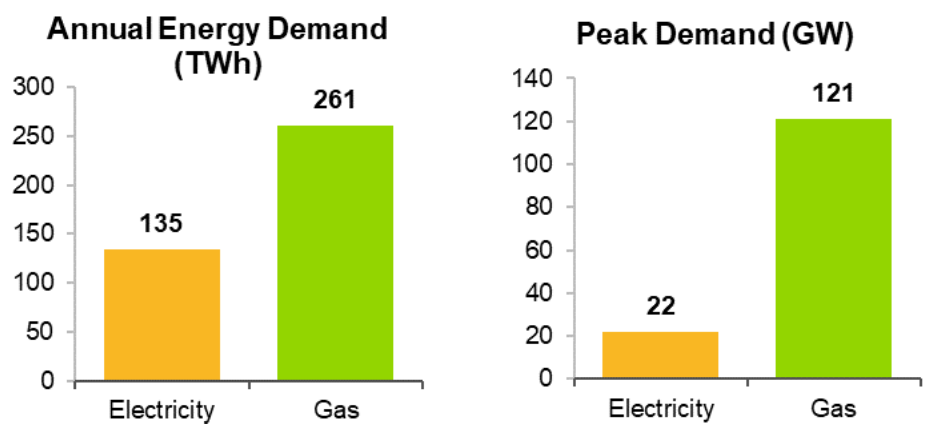
Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2

Preamble:

Figure 4. Comparison of Ontario's Electricity and Natural Gas Demand (2019)



Question(s):

a) Please provide an excel spreadsheet showing the total Ontario gas demand for each hour in 2019 and 2020. We wish to use the data to assess the "peakiness" of gas demand.

b) Please provide an excel spreadsheet showing the total Ontario electricity demand for each hour in 2019 and 2020. We wish to use the data to assess the "peakiness" of elect.

Note – We wish to use the above information to assess the "peakiness" of Ontario's gas demand and electricity demand; to compare the two; and assess the reports characterization of each.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Guidehouse declines to provide a response because the requested data was not used in the development of the Pathways to Net-Zero Emissions for Ontario (P2NZ) study. As a starting point, Guidehouse used annual and peak gas demand estimates from the ETSA study for the year 2020.

b) The electricity demand data for the starting decade of the study (2020) was sourced from the IESO for the calendar year 2019 to avoid any impacts due to the COVID-19 pandemic. The hourly demand profiles that Guidehouse referenced from 2019 are available from the IESO Data Directory.[1]

[1] IESO Data Directory. Available at: https://www.ieso.ca/en/Power-Data/Data-Directory#Ontario-and-Market-Demand

ENBRIDGE GAS INC.

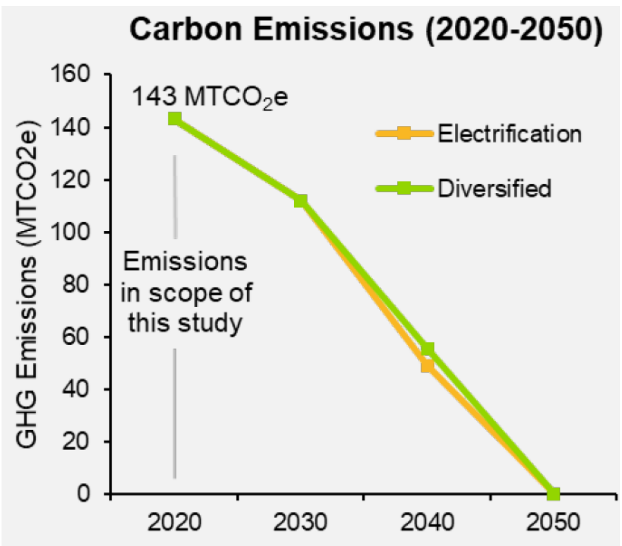
Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 3

Preamble:



Question(s):

a) Please provide an updated version of the above figure that accounts for the full lifecycle emissions associated with gaseous fuels (including as many of those listed in (b) as possible). Please provide all calculations and assumptions. Please make assumptions and state caveats as necessary.

For upstream emissions from fossil-fuel-based hydrogen, please use the figures found in the following peer-reviewed report or justify a decision to use different figures: Robert W. Howarth and Mark Z. Jackson, “How green is blue hydrogen?” Energy Science & Engineering, 26 July 2021 (link).

For the emissions of unburned methane from customer equipment, please use the figures found in the following peer-reviewed report or justify a decision to use different figures: Zachary Merrin and Paul W. Francisco, *Unburned Methane Emissions from Residential Natural Gas Appliances* (link).

b) Please indicate whether the following emissions are accounted for in Guidehouse's study and the above figure:

i. Upstream emissions for fossil gas consumed in Ontario (e.g. emissions from extraction, transportation leaks, etc.);
ii. Upstream emissions for hydrogen produced out-of-province and consumed in Ontario, including:

A. Uncaptured GHG emissions from the production of hydrogen from methane and the carbon capture process;
B. Fugitive methane emissions;
C. Fugitive hydrogen emissions (H2 is an indirect greenhouse gas, which reacts with other greenhouse gases in the atmosphere to increase their global warming potential);

iii. Fugitive methane emissions in Ontario from pipelines;
iv. Fugitive hydrogen emissions in Ontario from pipelines;
v. Fugitive methane emissions in Ontario from behind-the-meter equipment or pipes;
vi. Fugitive hydrogen emissions in Ontario from behind-the-meter equipment or pipes; and
vii. Emissions unsuccessfully captured in CCUS projects in Ontario.

c) Please provide a list of emissions related to RNG or hydrogen that are not accounted for in Guidehouse's study aside from those listed in (b), if any.

d) Please express the impact in terms of tCO2e of (i) 1 m3 of fugitive methane; (ii) 1 m3 of combusted methane; and (iii) 1 m3 of fugitive hydrogen.

e) What is Guidehouse's best estimate of the the global warming potential (GWP) of carbon dioxide, methane, and hydrogen? With respect to hydrogen, is the GWP 11 as per more recent research or 5.8 as per older studies ?

f) Please provide a copy of the above table in the units of MW/yr.

g) Please provide a best estimate of the GHG emissions (tCO2e/m3) from:

i. Upstream emissions (extraction and fugitive) for fossil gas consumed in Ontario, on average;
ii. Upstream emissions for hydrogen produced out-of-province and consumed in Ontario, on average, with and without CCUS;

iii. Fugitive emissions from leaks in Enbridge's gas infrastructure, on average;
iv. Fugitive emissions from behind-the-meter gas equipment and pipes, on average.

h) Please discuss the likely impact of hydrogen being a smaller molecule on the impact on the percentage of leakage from gas pipelines in comparison to methane. Please provide any studies that can be efficiency located on this topic.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Guidehouse declines to update the figure as requested, because Guidehouse does not concur with the upstream emissions factors presented in Howarth and Jackson (2021), for reasons stated in Guidehouse's response at Exhibit I.1.10-ED-58. In addition, accounting for lifecycle emissions only for gaseous fuels, without doing a full lifecycle assessment for all aspects of the gas and electricity systems, may lead to a biased result. A full lifecycle assessment for the energy systems in the report was out of scope for the report and is not feasible to complete in the interrogatory response period.

b) The following table indicates the emissions that are accounted for in the P2NZ Study and in Figure ES-2 "Carbon Emissions (2020-2050)

Table: Emissions Accounted for in the Guidehouse P2NZ Study

Emissions Stream	**Included / Not Included**
(i) Upstream emissions for fossil gas consumed in Ontario (e.g., emissions from extraction, transportation leaks, etc.)	Emissions from transmission pipeline losses are included; Emissions from extraction and processing activities are included for fossil gas consumed outside of CCS and blue hydrogen applications
(ii) Upstream emissions for hydrogen produced out-of-province and consumed in Ontario, including:	
(A) Uncaptured GHG emissions from the production of hydrogen from methane and the carbon capture process	Not Included

(B) Fugitive methane emissions	Not Included
(C) Fugitive hydrogen emissions (H2 is an indirect greenhouse gas, which reacts with other greenhouse gases in the atmosphere to increase their global warming potential)	Not Included
(iii) Fugitive methane emissions in Ontario from pipelines;	Included
(iv) Fugitive hydrogen emissions in Ontario from pipelines	Not Included
(v) Fugitive methane emissions in Ontario from behind-the-meter equipment or pipes	Not Included
(vi) Fugitive hydrogen emissions in Ontario from behind-the-meter equipment or pipes	Not Included
(vii) Emissions unsuccessfully captured in CCUS projects in Ontario	Included

c) Guidehouse has not noted any other RNG- or hydrogen-related emissions streams that are not listed in the table in part b).

d)

i. Guidehouse declines to provide the CO2-equivalent emissions of fugitive methane, because Guidehouse did not use an explicit assumption for this parameter. To estimate the emissions associated with gas transmission and midstream (GTM) fugitive methane, Guidehouse referenced Enbridge's Resilient Energy Infrastructure report,[1] which describes the impact of fugitive methane in terms of tonnes CO2e per billion cubic feet (bcf) of natural gas supplied. Counting Scope 1 and Scope 2 emissions for GTM, Guidehouse estimated fugitive methane emissions impacts using the parameter of 1,464.7 tCO2e per bcf of natural gas supplied.

ii. The P2NZ analysis used the emission factor of 0.001876 tCO2e/m3 for natural gas combustion.[2] Guidehouse divided "GHG Emissions by Energy Source (MTCO2e)" by "Energy Use by Energy Source (PJ)" to get 0.0483 MTCO2e/PJ, which was then converted to units of tCO2e/m3. Guidehouse also accounted for

[1] Enbridge (2019). "Resilient Energy Infrastructure Addressing Climate-Related Risks and Opportunities." p.25.
https://www.enbridge.com/~/media/Enb/Documents/Reports/Resilient_Energy_Infrastructure_report_FINAL.pdf
[2] NRCan National Energy Use Database, 2019 Version.

the CH4 and N2O emissions of RNG combustion using the emission factor 0.0113 kgCO2e/m3 from the National Inventory Report.[3]

iii. Guidehouse declines to answer this question because Guidehouse did not estimate the impacts of fugitive hydrogen. Hydrogen is not currently a reportable emission in Ontario.

e) Guidehouse has not independently evaluated the global warming potential of carbon dioxide, methane, or hydrogen. For the P2NZ study, Guidehouse did not need to apply GWP factors, because the data sources referenced by the analysis provided emissions factors in terms of CO2-equivalent emissions.

f) Guidehouse declines to answer this question because it is unclear to which table the question refers.

g)

i. Guidehouse assumed an emissions rate of 0.000052 tCO2e/m3 to account for fugitive emissions from gas transmission and midstream (GTM) for fossil gas consumed in Ontario. For fossil gas consumed in end user applications (not including blue hydrogen and CCS processes), Guidehouse assumed an emissions rate of 0.00021 tCO2e/m3 for upstream emissions from methane production and processing. /u

ii.-iv Guidehouse declines to answer these questions because Guidehouse did not estimate the emissions associated with upstream hydrogen production, methane distribution (aside for upstream and midstream emissions, noted in (i)), or fugitive behind-the-meter methane emissions.

h) Guidehouse declines to answer these questions, as Guidehouse has not independently studied the leak flow rates of hydrogen in gas pipelines.

ENBRIDGE GAS INC.

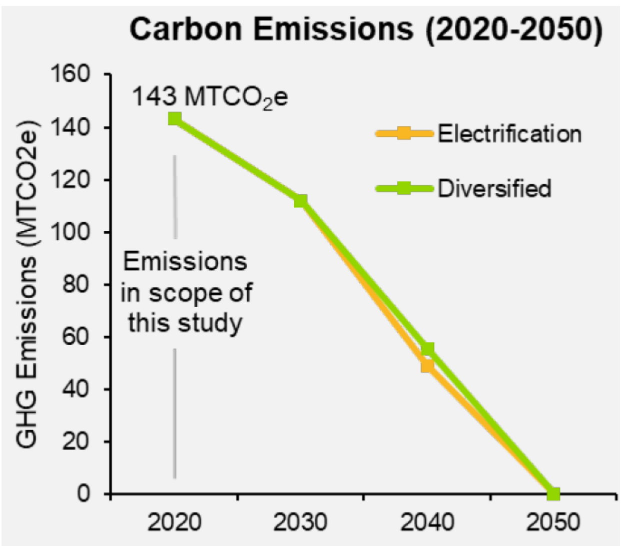
Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 3

Preamble:



Question(s):

a) Please provide an updated version of the above figure that does not factor-in negative emissions (e.g. direct air capture).

b) Please complete the following table indicating the volume and cost of the negative emissions (e.g. direct air capture) in each of the scenarios:

Negative Emissions by Scenario				
	2020	2030	2040	2050
Diversified scenario				
Negative emissions (tCOe2/yr)				
Breakdown of negative emission sources				
Cost to achieve negative emissions ($/yr)				
Electrification scenario				
Negative emissions (tCOe2/yr)				

Breakdown of negative emission sources				
Cost to achieve negative emissions ($/yr)				

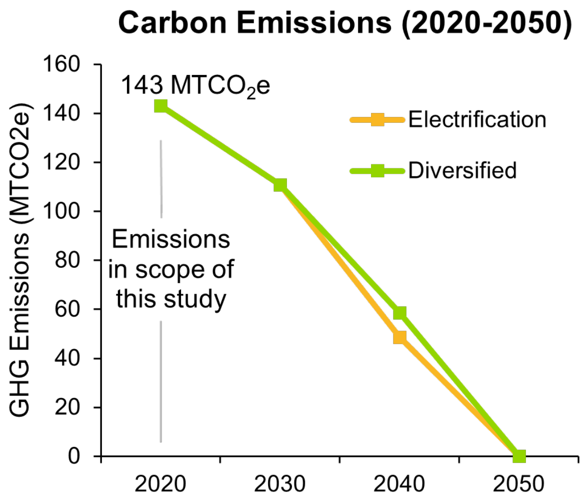
c) Please provide a breakdown of the origin of the remaining emissions sources from gaseous fuels (e.g. industrial, power generation, etc.) by scenario:

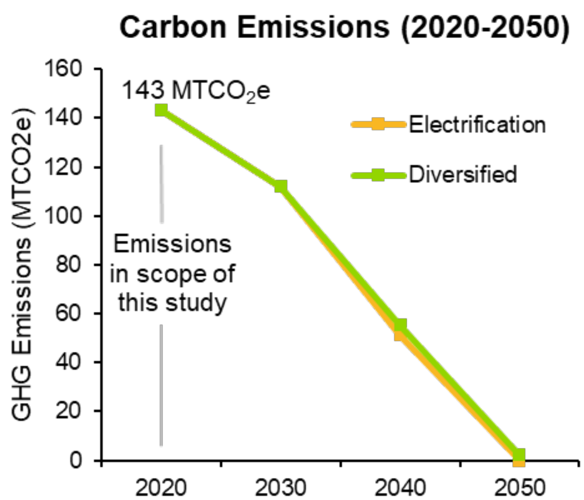
GHG Emission Sources by Scenario				
	2020	2030	2040	2050
Diversified scenario				
Source 1 (tCO2e/yr)				
…				
Source n (tCO2e/yr)				
Electrification scenario				
Source 1 (tCO2e/yr)				
…				
Source n (tCO2e/yr)				

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) The figure below shows carbon emissions from 2020-2050, omitting negative emissions from biomass paired with CCS technology. Guidehouse did not model direct air capture or other negative emissions technologies in the P2NZ study





b) The Table 1 describes the volume and cost of the negative emissions in each of the scenarios.

Table 1
Negative Emissions by Scenario

	2020	2030	2040	2050
Diversified scenario				
Negative emissions (MTCOe2/yr)	N/A	N/A	N/A	-2.40
Breakdown of negative emission sources	N/A	N/A	N/A	Biomass + CCS

/u

Cost to achieve negative emissions ($/yr)[1]	N/A	N/A	N/A	$605 M	/u
Electrification scenario					
Negative emissions (MTCOe2/yr)	N/A	N/A	-2.40	-4.81	
Breakdown of negative emission sources	N/A	N/A	Biomass + CCS	Biomass + CCS	
Cost to achieve negative emissions ($/yr)[1]	N/A	N/A	$605 M	$1,210 M	/u

c) The Table 2 below describes emissions from technologies modelled in the P2NZ study.

Table 2
GHG Emission Sources by Scenario (MTCOe2/yr)

	2020	2030	2040	2050	
Diversified scenario					
Anaerobic Digestion	0.00	0.01	0.03	0.05	/u
Fossil gas with point source CCS	0.00	0.27	0.64	0.75	/u
Fossil gas	51.25	49.52	27.86	0.00	/u
Hydrogen production via steam methane reforming with CCS (SMR + CCS)	0.00	0.87	1.63	1.60	/u
Transport Fossil Fuels	76.65	51.10	25.55	0.00	
Non-Gas Building Heating	3.20	2.13	1.07	0.00	
Coke / Coal	12.00	8.00	4.00	0.00	
Electrification scenario					
Anaerobic Digestion	0.00	0.00	0.02	0.02	/u
Fossil gas with point source CCS	0.00	0.00	0.36	0.57	/u
Fossil gas	51.25	49.66	18.04	0.0	/u
Hydrogen production via steam methane reforming with CCS (SMR + CCS)	0.00	0.33	0.86	0.86	/u
Transport Fossil Fuels	76.65	51.10	25.55	0.00

Coke / Coal	12.00	8.00	4.00	0.00	

[1] Annual costs ($/yr) presented here represent the average cost over each decade, including capital and O&M costs.

ENBRIDGE GAS INC.

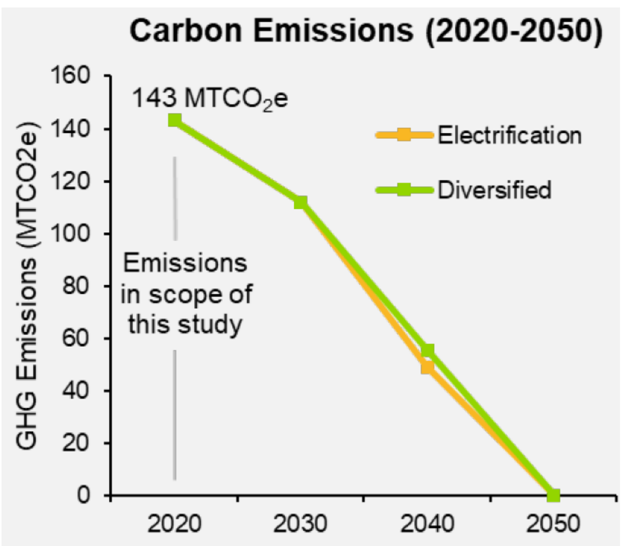
Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

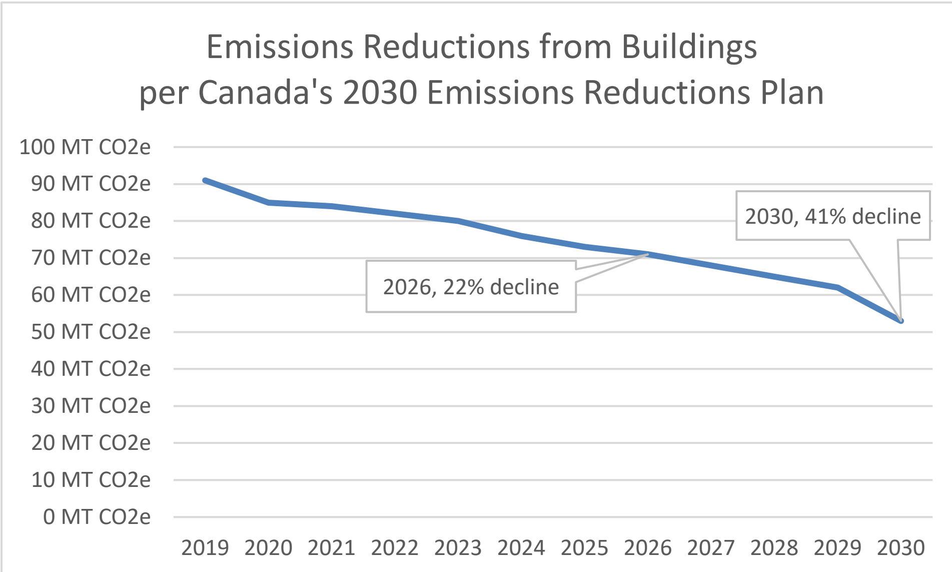
Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 3

Preamble:



Question(s):

a) Please add a line to the above figure to reflect the emissions reductions buildings per Canada's 2030 Emissions Reductions Plan (22% by 2026 and by 41% by 2030), which can be found in this footnote and are shown in the following chart. Please provide a response on a best-efforts basis, making assumptions and stating caveats as necessary. Please provide all underlying sources, calculations, and assumptions. To translate the national emissions reductions for buildings to provincial fossil gas emissions reductions, we recommend the following assumptions: (i) Ontario's share of reductions is proportional to Ontario's share of national emissions and (ii) all or almost all the reductions from buildings are achieved with respect to fossil gas consumption (as it constitutes almost all the GHGs from buildings). However, please use whatever assumptions Guidehouse believes are appropriate.



Response:

The following response was provided by Guidehouse Canada Ltd.:

a) The cited Figure ES-2 includes Ontario-specific emissions for the buildings, transportation, industry, and power sectors over a 30-year period. Intervenors requested the incorporation of Canada-wide buildings sector data for a 10-year period. Guidehouse declines to amend the cited Figure ES-2 as requested, on the basis that the geographic, temporal, and sectoral scopes of Figure ES-2 are all different from the data that intervenors request to incorporate.

ENBRIDGE GAS INC.

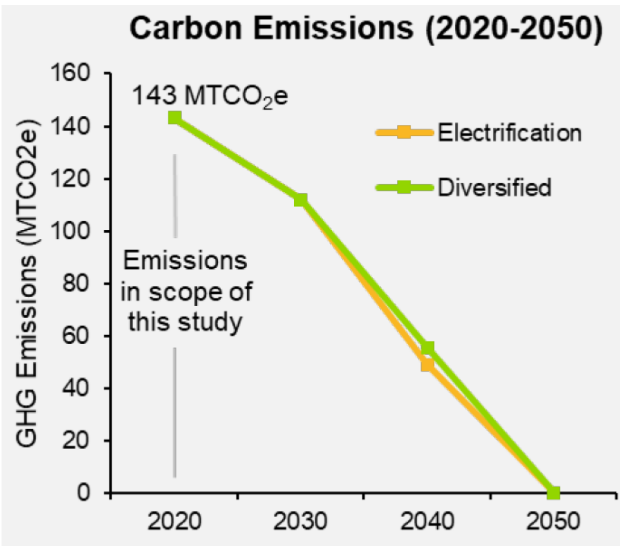
Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 3

Preamble:



Question(s):

a) Please provide a table with a breakdown of the emissions by sector by year (or by decade, if by year is not possible) corresponding to the above table for each of the two scenarios.

b) Please provide a table with a breakdown of the emissions by (i) gaseous fuels and (ii) other sources by year (or by decade, if by year is not possible) corresponding to the above table for each of the two scenarios.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) The following table includes emissions by sector, decade, and scenario.

Emissions by Scenario and Decade (million tCO2e)					
	2020	**2030**	**2040**	**2050**	
Diversified scenario					
Buildings sector	33.4	29.4	14.4	0.4	/u
Transportation sector	76.9	53.8	28.5	0.7	/u
Industrial sector	32.8	27.6	15.5	1.3	/u
Electrification scenario					
Buildings sector	33.4	28.8	10.7	0.1	/u
Transportation sector	76.9	51.2	25.8	0.3	/u
Industrial sector	32.8	30.8	14.5	1.0	/u

b) The following table includes a breakdown of energy system emissions by gaseous fuels and other sources, by decade and scenario, including negative emissions.

Energy System Emissions by Scenario and Decade (million tCO2e)					
	2020	**2030**	**2040**	**2050**	
Diversified scenario					
Renewable natural gas	0.00	0.01	0.03	0.05	/u
Biomass with CCS	0.00	0.00	0.00	-2.40	/u
Natural gas with CCS	0.00	0.27	0.64	0.75	/u
Natural gas	51.25	48.35	25.53	0.00	/u
Hydrogen from natural gas + CCS	0.00	0.87	1.63	1.60	/u
Gaseous fuels total	**51.25**	**49.49**	**27.83**	**0.00**	/u
Other Sources	**91.85**	**61.23**	**30.62**	**0**	
Electrification scenario					
Renewable natural gas	0.00	0.00	0.02	0.02	/u
Biomass with CCS	0.00	0.00	-2.40	-4.81	
Natural gas with CCS	0.00	0.00	0.36	0.57	/u
Natural gas	51.25	49.28	19.19	0.00	/u
Hydrogen from natural gas + CCS	0.00	0.33	0.86	0.86	/u
Gaseous fuels total	**51.25**	**49.61**	**18.02**	**-3.35**	/u
Other Sources	**91.85**	**61.23**	**30.62**	**0**	

ENBRIDGE GAS INC.

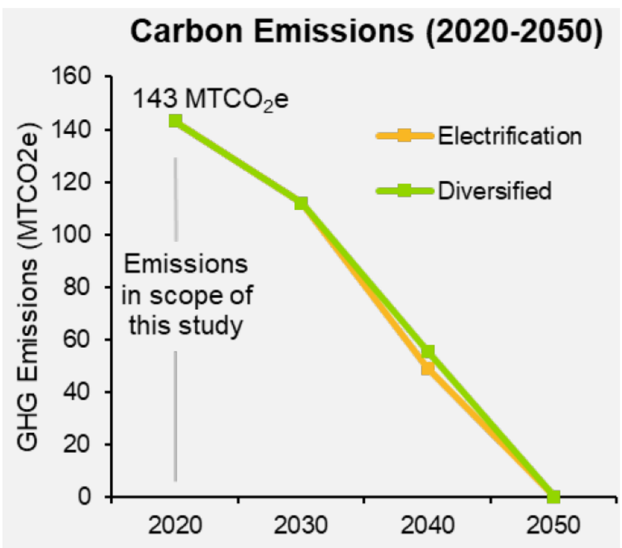
Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 3

Preamble:



Question(s):

a) Please provide a list of measures based on the Guidehouse study that would be attributable to the emissions reductions shown above for each scenario and the emissions reductions from each up to 2028. Please provide an answer on a best-efforts basis, making assumptions and stating caveats as necessary. Please provide all underlying calculations and assumptions. Please use the following format for the figures:

Emissions Reductions Sources by Scenario in 2028		
	Description	Expected reductions by 2028 (tCO2e)
Diversified scenario		
Measure 1		

…		
Measure n		
Electrification scenario		
Measure 1		
…		
Measure n		

b) This response will require both Guidehouse and Enbridge staff. Please complete the following tables comparing the scenarios with the emissions reductions forecast based on the current policies in place and Enbridge's application. Where there is a variance, please explain the variance and describe how it could be closed through additional relief from the OEB over the 2024-2028 period.

Emissions Reductions – Diversified Scenario vs. Enbridge Application

<u>Response:</u>

The following response was provided by Guidehouse Canada Ltd.:

a-b) Guidehouse declines to respond to this question. The energy demand and supply modeling conducted for the P2NZ study is complex and interactive, and under the current model design we cannot attribute emissions reductions from changes in supply to specific interventions. For example, a mix of different hydrogen production technologies (steam methane reforming with CCS versus electrolysis) are utilized both in Ontario and in neighbouring jurisdictions in each scenario. Therefore, the hydrogen delivered to end user customers to replace methane demand is a blend of these sources, each with their own emissions rate. A comprehensive data table for the emissions associated with each supply resource is provided in the response to Exhibit I.1.10-ED-29.

In addition, Guidehouse estimated emissions reductions on a decade basis and projections are not available for interim years such as the period from 2024 to 2028.

b) Enbridge Gas declines to complete a table that compares the scenarios in P2NZ with emissions reductions forecast based on the current policies in place and Enbridge Gas's application. Emissions reductions for the P2NZ scenarios over the 2024 to 2028 period are not available for the reasons stated in the response from Guidehouse in part a) above and, therefore, a comparison between emissions reductions over this period in the P2NZ scenarios and Enbridge Gas's application is not possible. Additionally, Enbridge Gas is unable to prepare a table of the emissions reductions based on the current policies in place and Enbridge Gas's application because the proposals included within Enbridge Gas's Energy Transition Plan (see Exhibit 1, Tab 10, Schedule 6, Table 1) do not yet have an associated emissions reduction forecast at this time. The Low Carbon Voluntary Program (LCVP) is not being addressed until phase 2 of the Rebasing Proceeding, and the Low Carbon Energy Project (LCEP) Phase 2 proposal will be brought forward in a separate application.

Enbridge Gas notes that in order to compare the emissions reductions based on the proposals within the application to the Diversified Portfolio scenario presented in the Energy Transition Scenario Analysis (ETSA) study, the Company engaged Posterity Group to develop an Energy Transition Initiative (ETI) scenario that is available at Exhibit 1, Tab 10, Schedule 6, Attachment 1. This scenario is based on changes to the assumptions for renewable natural gas (RNG), hydrogen and carbon capture and storage (CCS) that are aligned with the rebasing proposals plus the policy assumptions in the Diversified Portfolio scenario, not current policies as requested in the question.

Regarding additional support from the OEB over the 2024 to 2028 period, Enbridge Gas recommends that as the OEB continues to evolve its processes, frameworks and metrics to consider and account for the energy transition, that it focusses on enabling the most cost-effective, reliable and resilient GHG emissions reductions in Ontario, not solely on electrification. To enable this, Enbridge Gas believes that this would include having the OEB support and endorse integrated gas and electric planning, as discussed at Exhibit 1, Tab 10, Schedule 6, Section 2.4.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

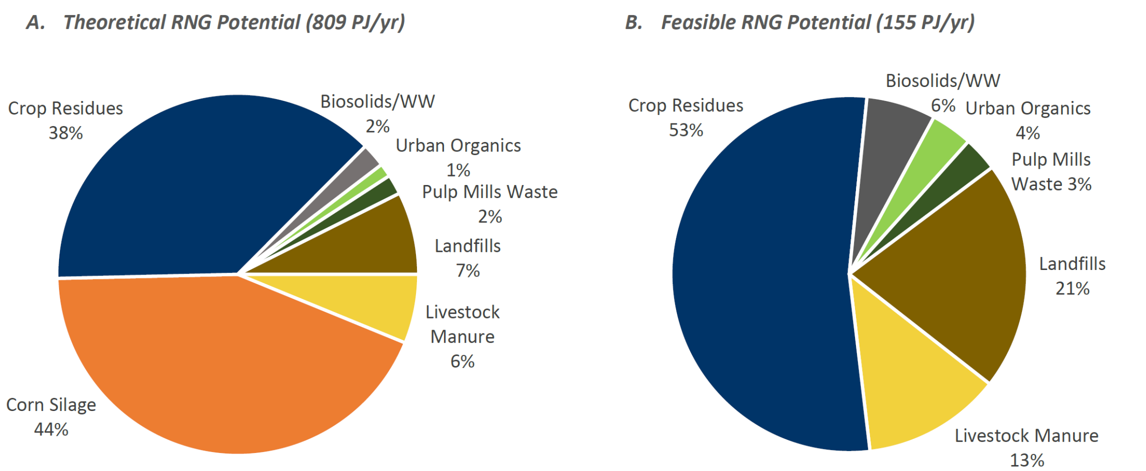
Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 19

Preamble:

“While the supply of RNG in Ontario is currently small and more costly that importing natural gas, the province has significant RNG production potential. Torchlight Bioresources estimated Ontario’s RNG potential via conventional RNG production technologies like anaerobic digestion and landfill gas. Torchlight’s report estimated that Ontario has the potential to produce around 40 PJ per year of RNG supply from wet organic wastes and up to around 240 PJ per year if agricultural residues are included. These agricultural residues reflect waste products such as corn stover and corn silage, and not new crop production that would need to be redirected to RNG production. This RNG potential represents roughly 4%-26% of Ontario’s annual natural gas demand. ”

Question(s):

a) The following figure from page 56 of the Torchlight Bioresources report relied on by Guidehouse study states that the “feasible RNG potential” is 155 PJ/yr for all of Canada. In contrast, Guidehouse states that Ontario’s RNG potential is 240 PJ/yr and includes 171 PJ/yr of RNG in its diversified scenario by 2050 (p. 40). Please provide the “feasible” RNG potential for Ontario. If necessary, please contact Torchlight Bioresources to determined the specific figure for Ontario. Please indicate in the response if they have been contacted.



<u>Response:</u>

The following response was provided by Guidehouse Canada Ltd.:

a) Page 18 of the *Pathways to Net Zero Emissions for Ontario* Study contains a typographical error in its reference to 240 PJ/year of RNG production potential. This value should be stated as 224 PJ/year of theoretical conventional RNG potential, a value Guidehouse referenced from Figure 19 of the Torchlight Report (reproduced below). Guidehouse used the 224 PJ/year value in calculations for the *Pathways* Study. The Torchlight Study does not include an estimate of feasible RNG production potential in Ontario, and Guidehouse is not aware of any such estimate. Guidehouse declined to contact Torchlight Bioresources for this estimate.

Figure 19. Annual Theoretical Conventional RNG Potential, by Province

Province/Territory	RNG Potential (Including Herbaceous)	RNG Potential (Excluding Herbaceous)	Feedstocks Exceeding 2.5 PJ/yr Potential
British Columbia	20	16	Corn silage, hog manure, landfills, pulp mills
Alberta	105	15	Crop residues, corn silage, landfills, cattle feedlot manure
Saskatchewan	112	3	Crop residues, corn silage
Manitoba	70	4	Crop residues, corn silage
Ontario	224	41	Corn silage, landfills, crop residues, biosolids/wastewater, hog manure, poultry manure, urban organics
Quebec	116	38	Corn silage, landfills, hog manure, crop residues, pulp mills, biosolids/wastewater, dairy manure
New Brunswick	5	4	-
Nova Scotia	4	2	-

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 19

Preamble:

"While the supply of RNG in Ontario is currently small and more costly that importing natural gas, the province has significant RNG production potential. Torchlight Bioresources estimated Ontario's RNG potential via conventional RNG production technologies like anaerobic digestion and landfill gas. Torchlight's report estimated that Ontario has the potential to produce around 40 PJ per year of RNG supply from wet organic wastes and up to around 240 PJ per year if agricultural residues are included. These agricultural residues reflect waste products such as corn stover and corn silage, and not new crop production that would need to be redirected to RNG production. This RNG potential represents roughly 4%-26% of Ontario's annual natural gas demand. "

Question(s):

a) Is the 40 PJ to 240 PJ of Ontario RNG potential that Guidehouse references from the Torchlight Bioresources report the "feasible potential" or the "theoretical conventional RNG potential" (per p. 27 of the Torchlight report)? If neither, please explain.

b) Please describe the difference between the "feasible" and "theoretical" RNG potential as described in the Torchlight Bioresources report.

c) Please confirm that Torchlight Bioresources estimates that there is "660 PJ of theoretical conventional RNG potential" in Canada (per p. 54) and 155 PJ/yr of "feasible RNG potential" in Canada (p. 56). If not, please explain.

d) Please confirm that, according to Torchlight Bioresources, the theoretical conventional RNG potential in Canada is over 4.2 times the feasible RNG potential.

e) Please provide the Ontario RNG consumption assumed in the Guidehouse report for each scenario annually between 2020 and 2050. Please express the answer in a table showing both m3 and PJ.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Guidehouse refers to the response at Exhibit I.1.10-ED-31 part a). The technical potential was used as a simplifying assumption, and Guidehouse notes that the market for RNG spans North America, and Ontario's consumption of RNG will not be bounded by the potential for in-province RNG production.

b) Guidehouse understands that Torchlight estimated the "theoretical" potential as the sum of potential production from all RNG feedstocks, without considering the economics of individual projects. Guidehouse understands that Torchlight estimated the "feasible" RNG potential by excluding sources of RNG feedstock where RNG production may be limited by economic constraints. For example, Torchlight notes that small landfill or anaerobic digestion projects may find RNG production and pipeline injection uneconomical due to economies of scale or distance from natural gas pipelines. Torchlight also notes that, "The percentage of feedstock actually converted to RNG will be strongly impacted by pricing and availability of complementary co-digestion feedstocks."

   Guidehouse expects that the definition of "feasibility" will evolve over time with changing commodity prices and escalating carbon taxes, and as pilot projects demonstrate new methods of RNG collection that overcome economy-of-scale issues.

c) Guidehouse confirms that the Torchlight Bioresources 2020 report estimates there is 809 PJ of total theoretical RNG potential (p.iii), 660 PJ of theoretical conventional RNG potential in Canada (p. 54) and 155 PJ/yr of "feasible RNG potential" in Canada (p.iii).

d) Guidehouse confirms that, according to Torchlight Bioresources, the theoretical conventional RNG potential in Canada is over 4.2 times the feasible RNG potential.

e) For the *Pathways to Net Zero Emissions for Ontario* Study, Guidehouse estimated RNG consumption on a decade basis. Table 1 provides the Ontario RNG consumption assumed in the Guidehouse report for each scenario between 2020 and 2050.

Table 1
Projected RNG Consumption in Ontario, by scenario and decade

Scenario	Unit	2020	2030	2040	2050	
Diversified Scenario	bcm	0.0	1.2	2.5	4.7	/u
	PJ	0.0	44.3	91.4	170.6	/u
Electrification Scenario	bcm	0.0	0.0	1.6	2.0	/u
	PJ	0.0	0.0	59.0	72.4	/u

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 19 & 40

Preamble:

Per p. 40: "The increase in supply capacity for RNG production will be primarily via anaerobic digestion, reaching 171 PJ by 2050 in the Diversified scenario and 139 PJ in the Electrification scenario. These figures represent a significant share of Ontario's RNG potential, estimated to be 240 PJ. "

Per p. 19: "Torchlight's report estimated that Ontario has the potential to produce around 40 PJ per year of RNG supply from wet organic wastes and up to around 240 PJ per year if agricultural residues are included. These agricultural residues reflect waste products such as corn stover and corn silage, and not new crop production that would need to be redirected to RNG production. This RNG potential represents roughly 4%-26% of Ontario's annual natural gas demand. "

Question(s):

a) The only reference we can find in the Torchlight Bioresources report that provides a breakdown for the Ontario potential is the "Theoretical Conventional RNG Potential" at page 27 of the report (excepted below). That lists the "theoretical" potential as being 224 PJ (including herbaceous) and 41 PJ (excluding herbaceous). Is Guidehouse's reference to Ontario's RNG potential being 240 PJ a typo? If not, please explain how Guidehoue can assume an RNG potential based on the Torchlight Bioresources report that is higher than even the "theoretical potential" in the Torchlight Bioresources report, let alone the feasible potential in that report.

Figure 19. Annual Theoretical Conventional RNG Potential, by Province

Province/Territory	RNG Potential (Including Herbaceous)	RNG Potential (Excluding Herbaceous)	Feedstocks Exceeding 2.5 PJ/yr Potential
British Columbia	20	16	Corn silage, hog manure, landfills, pulp mills
Alberta	105	15	Crop residues, corn silage, landfills, cattle feedlot manure
Saskatchewan	112	3	Crop residues, corn silage
Manitoba	70	4	Crop residues, corn silage
Ontario	224	41	Corn silage, landfills, crop residues, biosolids/wastewater, hog manure, poultry manure, urban organics
Quebec	116	38	Corn silage, landfills, hog manure, crop residues, pulp mills, biosolids/wastewater, dairy manure
New Brunswick	5	4	-
Nova Scotia	4	2	-
Prince Edward Island	2	0	-
Newfoundland and Labrador	1	1	-
Canada	**660**	**123**	**All**

b) Why does Torchlight Bioresources differentiate between the potential including and excluding herbaceous? Is that because herbaceous feedstocks have competing uses and therefore may not be available for RNG?

c) Please provide a breakdown of the herbaceous feedstocks available in Ontario (PJ), indicating which are currently used for other purposes.

d) How much of Ontario’s RNG potential (JP) is from corn silage/stover?

e) Please confirm that corn silage/stover can be used as fodder, bedding, or a soil amendment.

f) Approximately how much (PJ) of Ontario’s available corn silage/stover is already being used as fodder, bedding, or a soil amendment.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Page 18 of the *Pathways to Net Zero Emissions for Ontario* study contains a typographical error in its reference to 240 PJ/year of RNG production potential. This value should be stated as 224 PJ/year of theoretical conventional RNG potential, a value Guidehouse referenced from Figure 19 of the Torchlight report. Guidehouse used the 224 PJ/year value in calculations for the *Pathways* study.

b) Guidehouse understands that the Torchlight Bioresources report justifies the differentiation between herbaceous and non-herbaceous feedstocks on page 57 of the report, where it states, “While crop residues can certainly contribute to the RNG total, the reality is that surplus crop residues can be converted to thermal energy (building heat, process heat) at a higher efficiency and with lower costs using combustion technology.”

   Guidehouse notes that RNG has advantages over crop residues as a heating fuel in that RNG may be transported via existing gas networks, and RNG may be used as a drop-in replacement for conventional natural gas that does not require conversion of existing gas-fired heating equipment.

c) Guidehouse understands that the Torchlight Bioresources report does not provide a comprehensive estimate of herbaceous feedstocks available in Ontario, and Guidehouse is unaware of other sources for this data.

d) Guidehouse used the information provided for Ontario census divisions in Appendix 1 of the Torchlight Bioresources report to calculate a sum of the corn silage resource potential available in Ontario. The data provided in Appendix 1 of the Torchlight Bioresources indicates that 167.3 PJ of Ontario’s RNG resource potential is from corn silage, which Guidehouse understands is a subset of herbaceous feedstocks.

e) Section 3.1 of the Torchlight Bioresources report indicates that corn silage/stover can be used as fodder, bedding, or a soil amendment. Guidehouse references the following quotes from page 30 of the Torchlight Bioresources report:

   - “Some stover must remain on the soil surface following harvest to support soil and ecosystem health…”
   - “At the present time, stover is underused with minor amounts serving as AD feedstock or as feed or bedding for dairy cattle.”
   - “Corn silage is produced annually from feed corn as an energy-dense dairy cattle feed.”

f) Figure 21 of the Torchlight Bioresources report indicates that in the current situation (Scenario A of Figure 21), 3.8 megatonnes of silage is used as livestock feed, and 6.7 megatonnes of stover is used for soil retention. The Torchlight report does not express these amounts in terms of petajoules, nor does it provide a factor for converting megatonnes of silage/stover into petajoules.

[’ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 19 & 40

Preamble:

Per p. 19 of the Guidehouse report: “Torchlight’s 240 PJ estimate is based on anaerobic digestion and landfill potential and does not reflect more advanced RNG production technologies like biomass gasification or power-to-gas, which are not yet commercially available.”

Per p. 40 of the Guidehouse report: “Other RNG production technologies such as biomass gasification do not play major roles in RNG supply today; however, local conditions and the availability of low-cost biomass feedstock (such as in Northern Ontario) may encourage the development of gasification plants in the future.”

Per p. 54 of the Torchlight Bioresources report: “This bottom-up resource analysis has shown the theoretical potential for RNG production in Canada is approximately 809 PJ per year … Of this 809 PJ, 660 PJ is the theoretical potential for conventional RNG. This excludes precommercial wood-to-gas pathways of gasification and methanation, and pyrocatalytic hydrogenation (150 PJ). As identified in Section 4.3 and as stated by stakeholders in a recent national survey, these technologies face major scale-up hurdles.47,59 In addition, if RNG from wood is used for building or process heat, the production pathway will be notably lower efficiency and higher capital cost than direct combustion of solid wood fuel.

Question(s):

a) Does Guidehouse agree that RNG from the gasification of wood is “notably lower efficiency and higher capital cost than direct combustion of solid wood fuel” if the RNG is to be used to generate heat?

b) Does Guidehouse believe it is likely that RNG from biomass gasification will become cost-effective?

c) Approximately how much does it cost ($/m3) to produce RNG from biomass gasification?

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Guidehouse agrees that, at present, the production of RNG from the gasification of wood is lower efficiency and higher capital cost than direct combustion of solid wood fuel if the RNG is to be used to generate heat. Guidehouse notes that RNG has advantages over solid wood as a heating fuel in that RNG may be transported via existing gas networks, and RNG may be used as a drop-in replacement for conventional natural gas that does not require conversion of existing gas-fired heating equipment.

b) Guidehouse expects that development and commercialization of biomass gasification technologies will lead over time to improved process efficiencies and reduced costs. The cost-effectiveness of biomass gasification will be influenced by many factors, including the commodity cost of competing fuels, escalating carbon taxes, and potential incentives for alternative fuel production. Given the uncertainties around these and other influences, Guidehouse cannot foresee whether biomass will become cost-effective in the future.

c) Guidehouse has not independently assessed the cost of producing RNG from biomass gasification.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 19 & 40

Preamble:

Per p. 40 of the Guidehouse report: “The increase in supply capacity for RNG production will be primarily via anaerobic digestion, reaching 171 PJ by 2050 in the Diversified scenario and 139 PJ in the Electrification scenario. These figures represent a significant share of Ontario’s RNG potential, estimated to be 240 PJ. ”

Per page 54 of the 2017 MACC report for the OEB:

Table 22 Summary of the National and Ontario Provincial RNG Potential in 2028 by Feedstock

Feedstock	National Potential by 2028 (million m^3/yr)	National Potential by 2028 (tCO_2/yr)	Ontario Potential by 2028 (million m^3/yr)	Ontario Potential by 2028 (tCO_2/yr)	LCOE ($\$/m^3$)	Notes
Landfill gas	290	540,000	113	210,000	\$0.33-\$0.82	Evaluated 5 different sized facilities based on survey referenced in Canadian Biogas Study; linked to study for Environment Canada
WWT gas	180	340,000	71	135,000	\$0.48-\$3.73	Evaluated 4 different sized facilities – ICF analysis
Animal manure	874	1,640,000	191	360,000	\$0.87-\$1.66	Considered 3 different farms (Electrigaz study): baseline, large, and co-op
SSO residential & commercial	300	560,000	110	210,000	\$2.90	Assumed a single facility capable of processing 60,000 tonnes/yr per Canadian biogas study. Larger/smaller facilities conceivable

Question(s):

a) What is Guidehouse's best estimate of Ontario's RNG potential by 2028? Please provide a breakdown by feedstock, including the price for each ($/m3).

b) What are the conversion factors between (i) $/m3 and $/PJ of RNG, and (ii) m3 to PJ of RNG?

c) Please fill out the following table comparing the Ontario RNG potential and cost per the above-referenced OEB report with Guidehouse figures.

Comparison of 2028 RNG Potential, Consumption & Cost Figures OEB MACC vs Guidehouse						
Feedstock	**Potential per OEB Study (M m3/yr)**	**Potential per Guidehouse estimate (M m3/yr)**	**Consumption per diversified scenario (M m3/yr)**	**Consumption per electrified scenario (M m3/yr)**	**Cost per OEB Study ($/m3)**	**Cost per Guidehouse estimate ($/m3)**
[E.g. landfill gas, WWT gas, manure, etc.]						

d) Please file a copy of all studies estimating the RNG potential in Ontario that Guidehouse is aware of.

e) Please summarize the conclusions of RNG potential studies referred to in (d) regarding Ontario's RNG potential in the following table:

Ontario's RNG Potential – Comparison of Report Conclusions					
Feedstock	**OEB MACC (potential year)[1]**	**Torchlight Bioresources (potential year)**	**Report 3 (potential year)**	**…**	**Report n (potential year)**
[E.g. landfill gas, WWT gas, manure, etc.]					

[1] i.e. the year in which the stated potential is described in the report as being available.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Guidehouse declines to answer this question because Guidehouse has not independently estimated Ontario's RNG potential in 2028.

b) Guidehouse used a conversion factor of 1 million m^3 RNG = 0.0388 PJ RNG.

c) Guidehouse declines to complete the table as specified because (i) Guidehouse's analysis estimated the required RNG production capacity on a decade basis (i.e., capacity in 2030, 2040, and 2050) and did not estimate the RNG potential in the year 2028; and (ii) Guidehouse's approach to cost modeling did not determine commodity prices of RNG on a $/$m^3$ basis.

   As illustrated in Figure 17 and Table A-8 of the P2NZ report, Guidehouse estimates that the required annual production of RNG in 2030 would be 49 PJ/year (about 1,263 million m^3/year) in the Diversified scenario and 1 PJ/year (about 26 million m^3/year) in the Electrification scenario.

   Guidehouse's approach to cost modeling did not determine commodity costs of RNG on a $/$m^3$ basis. Instead, Guidehouse accounted for the cost of RNG supplies by (1) determining the required production capacity by decade, (2) estimating the capital costs of developing RNG production capacity, and (3) estimating the fixed and variable O&M costs of using this capacity to produce RNG. Table A-11 of the P2NZ report describes the capital and O&M costs assumed for RNG production in 2030, 2040, and 2050.

d) Guidehouse is aware of the following studies of RNG potential in Ontario:

   i. Torchlight Bioresources (2020). "Renewable Natural Gas (Biomethane) Feedstock Potential in Canada." Available at: https://www.enbridge.com/~/media/Enb/Documents/Media%20Center/RNG-Canadian-Feedstock-Potential-2020%20(1).pdf?la=en
   ii. Kelleher Environmental, Robins Environmental (2013). Canadian biogas study – benefits to the economy, environment and energy. Technical Document. Prepared for the Canadian Biogas Association. See Table 11. Available at: https://biogasassociation.ca/images/uploads/documents/2014/biogas_study/Canadian_Biogas_Study_Technical_Document_Dec_2013.pdf

iii. Alberta Research Council (2010). “Potential Production of Methane from Canadian Wastes.” Available at: https://biogasassociation.ca/images/uploads/documents/2010/Potential_Production_of_Methane_from_Canadian_Wastes-ARC_FINAL_Report-Sept_23_2010.doc

e) Guidehouse declines to complete the table as specified. The reports cited in (d) are available for public review. However, the feedstock definitions and timelines for potential resource availability are not consistently defined, so a side-by-side comparison of results from these reports is not possible.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 19, 40, & A-5

Preamble:

The following questions focus on the cost of RNG. Responses are needed to test and analyze (i) the Guidehouse report; (ii) the Application's reliance on the Guidehouse report; and (iii) Enbridge's assertion that its proposed capital spending likely will not be stranded because it can be used in the future for a large quantity of cost-effective renewable natural gas.

Question(s):

a) Please provide all assumptions in the Guidehouse report regarding the cost of RNG ($/m3). Please explain the basis of those assumptions, including the assumed feedstocks and assumed prices for each feedstock. Please provide all sources.

b) Please complete the following tables:

RNG Volumes and Cost by Feedstock – Diversified Scenario				
	2020	**2030**	**2040**	**2050**
Feedstock 1				
Volume (m3)				
Unit cost ($/m3)				
…				
Feedstock n				
Volume (m3)				
Unit cost ($/m3)				
Total of all feedstocks				

Volume (m3)				
Unit cost – weighted average ($/m3				

RNG Volumes and Cost by Feedstock – Electrified Scenario				
	2020	**2030**	**2040**	**2050**
Feedstock 1				
Volume (m3)				
Unit cost ($/m3)				
…				
Feedstock n				
Volume (m3)				
Unit cost ($/m3)				
Total of all feedstocks				
Volume (m3)				
Unit cost – weighted average ($/m3)				

c) If Guidehouse has data to complete the tables in (b) on an annual basis, please provide those tables on an annual basis.

d) Please file a copy of all studies estimating the RNG cost that would be applicable to Ontario that Guidehouse is aware of. Please include the studies that Guidehouse relied on, as well as the studies that Guidehouse decided not to rely on (indicating why it chose not to rely on them).

e) Please summarize the conclusions of the RNG cost studies referred to in (m) regarding in the following table:

RNG Cost in Ontario ($/m3) – Comparison of Report Conclusions					
Feedstock	**Report 1 (year)**[1]	**Report 3 (year)**	**Report 3 (year)**	**…**	**Report n (year)**
Feedstock 1					
…					
Feedstock n					
Weighted average					

Response:

The following response was provided by Guidehouse Canada Ltd.:

a-e) Guidehouse declines to answer the questions regarding unit costs of RNG production. The purpose of the P2NZ report was to estimate the total costs for each scenario to achieve net-zero emissions by 2050. To estimate total costs, Guidehouse accounted for the capital cost of new RNG projects (CONE), the fixed O&M costs (FOM) of operating RNG production capacity regardless of output, and the variable O&M costs (VOM) which scale based on production volume. The CONE and FOM costs for anaerobic digestion are provided in Table A-11 of the P2NZ study. Guidehouse derived these costs from a 2021 U.S. EPA report[2] that describes the capital and O&M costs of a gas collection and flare system (page 4-3) and the capital and O&M costs of a typical RNG pipeline-injection project with a 2-mile pipeline and a 15-year lifetime (page 4-10). For the infrastructure needed to upgrade and inject RNG into natural gas networks, Enbridge Gas Inc. provided Guidehouse with capital and O&M cost estimates based on a sample of projects scoped by Enbridge Gas.

Guidehouse did not estimate a cost per unit production of RNG, as the intent of the study was not to model commodity costs or market prices for RNG.

Guidehouse cannot determine the cost per unit production of RNG from the output of our Low Carbon Pathways model because the cost per unit production would include other project parameters (e.g., taxes, cost of financing, etc.) that we have not estimated.

[1] i.e. The year that the cost estimate relates to if it is not a current-year estimate.
[2] U.S. EPA (2021). “LFG Energy Project Development Handbook.” pp. 4-3 to 4-10. Available at: https://www.epa.gov/system/files/documents/2021-07/pdh_full.pdf

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 20

Preamble:

"Prior studies have assessed CCS options in Ontario and have determined that the only sequestration option is geological sequestration in saline aquifers. Carbon dioxide is expected to be stored in these aquifers for long periods, from one hundred years to several thousand years depending on the size, properties, and location of the reservoir. Prior studies identified two different major reservoirs appropriate for CCS in southwestern Ontario: one located in the southern part of Lake Huron and the other located inside Lake Erie. These sites have approximate storage capacities of 289 million and 442 million tonnes of CO2 emissions. "

Question(s):

a) What is the average lifetime of the equipment needed for a CCS facility?

b) For economic assessments of CCS facilities, what are the typical assumed economic lifetimes? In other words, approximately how many years of operating revenue would be required to recoup the upfront capital investment?

c) Please complete the following table indicating the annual and cumulative quantity of CO2 to be sequestered in Ontario under the two scenarios. For years beyond 2050, please extrapolate the annual CO2 to be sequestered based on the previous 5-year trend (or make, state, and explain a different assumption if Guidehouse believes a different assumption is warranted for future years). If annual figures are not possible, please provide the figures by decade. This question is meant, in part, to explore how long it would take for the aquifers to be full.

Ontario-Based Carbon Sequestration Volumes by Scenario Annual and Cumulative				
	2020	2021	….	Year in which cumulative total is 731 M t CO2e
Diversified				
Annual (MtCO2)				
Cumulative (MtCO2)				
Electrified				
Annual (MtCO2)				
Cumulative (MtCO2)				
Estimated reservoir capacity	731	731	731	731

d) Please complete the following table indicating the annual and cumulative quantity of CO_2 to be sequestered in Ontario under the scenarios with a breakdown between CCS for blue hydrogen occurring in Ontario (SMR & CCS) and combustion of fossil gas. For years beyond 2050, please extrapolate the annual CO_2 to be sequestered based on the previous 5-year trend (or make, state, and explain a different assumption if Guidehouse believes a different assumption is warranted for future years). This question is meant, in part, to explore how long it would take for the aquifers to be full.

Ontario-Based Carbon Sequestration Volumes by Scenario Annual and Cumulative				
	2020	2021	….	2050
Diversified				
Blue hydrogen consumption (PJ/yr)				
Blue hydrogen CO2 capture (MtCO2e/yr)				
Fossil gas combustion (PJ/yr)				
Fossil gas combustion capture (MtCO2e/yr)				
Total capture (MtCO2e/yr)				

Electrified				
Blue hydrogen consumption (PJ/yr)				
Blue hydrogen CO2 capture (MtCO2e/yr)				
Fossil gas combustion (PJ/yr)				
Fossil gas combustion capture (MtCO2e/yr)				
Total capture (MtCO2e/yr)				

<u>Response:</u>

The following response was provided by Guidehouse Canada Ltd.:

a-b) Guidehouse estimated the typical lifetime of a CCS facility is 25 years. Guidehouse did not estimate the economic lifetime of CCS facilities.

c-d) Guidehouse calculated the annual consumption of hydrogen and natural gas and the annual amount of CO_2 storage on a decade basis through the year 2050. The following table indicates the annual consumption of blue hydrogen and natural gas with CCS. The table also states the quantity of CO_2 to be sequestered in Ontario under each scenario, with a breakdown between CCS for blue hydrogen occurring in Ontario (SMR & CCS) and combustion of fossil gas with CCS. Cumulative quantities of stored CO_2 are reported in the table for the year 2050. Page to 41 of the *Pathways to Net Zero Emissions for Ontario* Report states the following: /u

"The CO_2 storage requirements for the Diversified and Electrification scenarios up to 2050 would be satisfied with these two reservoirs. In the Diversified scenario, these two major reservoirs would provide sufficient storage volumes up to 20582063, while in the Electrification scenario, they would be sufficient up to 20772086. /u

Ontario-Based Carbon Sequestration Volumes by Scenario Annual and Cumulative					
	2020	2030	2040	2050	
Diversified					
Blue hydrogen consumption (PJ/yr)	0 / year	146 / year	238 / year	231 / year	/u
Blue hydrogen CO2 capture (MtCO2e/yr)	0.0	10.1 / year	16.5 / year	16.0 / year 255.4 cum.	/u
Fossil gas combustion with CCS (PJ/yr)	0.0	48 / year	116 / year	136 / year	/u
Fossil gas combustion capture (MtCO2e/yr)	0.0	2.3 / year	5.5 / year	6.5 / year 76.6 cum.	/u
Total capture (MtCO2e/yr)	0.0	12.4 / year	22.0 / year	22.5 / year 332.1 cum.	/u
Electrified					
Blue hydrogen consumption (PJ/yr)	0 / year	88 / year	94 / year	90 / year	/u
Blue hydrogen CO2 capture (MtCO2e/yr)	0.0	6.1 / year	6.5 / year	6.2 / year 119.6 cum.	/u
Fossil gas combustion with CCS (PJ/yr)	0.0	0 / year	65 / year	107 / year	/u
Fossil gas combustion capture (MtCO2e/yr)	0.0	0.0 / year	3.1 / year	5.1 / year 33.0 cum.	/u
Total capture (MtCO2e/yr)	0.0	6.1 / year	9.6 / year	11.3 / year 152.6 cum.	/u

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 20

Preamble:

"Prior studies have assessed CCS options in Ontario and have determined that the only sequestration option is geological sequestration in saline aquifers. Carbon dioxide is expected to be stored in these aquifers for long periods, from one hundred years to several thousand years depending on the size, properties, and location of the reservoir. Prior studies identified two different major reservoirs appropriate for CCS in southwestern Ontario: one located in the southern part of Lake Huron and the other located inside Lake Erie. These sites have approximate storage capacities of 289 million and 442 million tonnes of CO2 emissions.[1] "

Question(s):

a) Please provide a map showing the location and size of the potential CCS locations in Ontario.

b) Please confirm that the two potential CCS locations in Ontario fall along the Canada-US border.

c) Would use of the CCS locations in Ontario require an agreement or permit(s) from the United States federal government or a state government in light of the fact that the reservoir crosses the international border?

d) Please provide the cost of CCS in Ontario ($/tCO2e) assumed in the Guidehouse report, the basis for that estimate, identify the CCS projects that serve as the basis for that cost estimate, and describe those CCS projects (e.g. the geologic formation they are in). Please break down the cost into the cost of capturing the CO2 and sequestering it.

---

[1] Shafeen, Ahmed & Croiset, Eric & Douglas, Peter & Chatzis, Ioannis. (2004). CO2 sequestration in Ontario, Canada. Part I: Storage evaluation of potential reservoirs. Energy Conversion and Management. 45. 2645-2659. Available: http://dx.doi.org/10.1016/j.enconman.2003.12.003

e) Do the two potential CCS locations in Ontario raise additional challenges (e.g. being under lakes) that may raise costs in comparison to the CCS projects that served as the basis for Guidehouse' estimate of the costs of CCS in Ontario?

Response:

a-b) A map showing the two potential CCS locations in Ontario can be found in Figure 12 of the 2007 Ontario Ministry of Natural Resources report titled "Geological Sequestration of Carbon Dioxide: A Technology Review and Analysis of Opportunities in Ontario".[2] The report identifies the potential capacity of the northern zone at 289 Mt of CO_2 and 442 Mt of CO_2 in the southern zone.

c) The permits that may or may not be required are unknown at this time. Currently the Ministry of Natural Resources and Forestry (MNRF) regulates and permits natural gas production from the Crown land under the Canadian portion of Lake Erie and has indicated, in its "Roadmap towards regulating geologic storage"[3] that it intends to design a framework to regulate commercial-scale geologic carbon storage projects on Crown land and private land.

The following response was provided by Guidehouse Canada Ltd.:

d) Guidehouse did not evaluate costs of Ontario-specific CCS storage. Guidehouse referenced generalized estimates of CCS costs from a 2021 study[1] and a 2019 study[2], both of which provide a broad list of references and cost ranges. The 2021 study references a range of 20 to 50 EUR/tCO_2e, and the 2019 study references figures ranging from 15 to 105 EUR/tCO_2e. Based on these sources, Guidehouse assumed CCS costs of 95 CAD$/t$CO_2$e. This assumption represents an average of a low estimate of 50 EUR /tCO_2e and a high estimate of 80 EUR /tCO_2e.

The sources referenced provide generalized cost estimates that are not tied to specific CCS projects or geologic storage sites, and do not break down costs into costs for capture and for sequestration.

e) Guidehouse declines to answer this question because Guidehouse has not independently compared the challenges or costs of storing carbon in Ontario sites with the CCS cost assumptions referenced in (d) above.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 20

Preamble:

“Prior studies have assessed CCS options in Ontario and have determined that the only sequestration option is geological sequestration in saline aquifers. Carbon dioxide is expected to be stored in these aquifers for long periods, from one hundred years to several thousand years depending on the size, properties, and location of the reservoir. Prior studies identified two different major reservoirs appropriate for CCS in southwestern Ontario: one located in the southern part of Lake Huron and the other located inside Lake Erie. These sites have approximate storage capacities of 289 million and 442 million tonnes of CO2 emissions. ”

Question(s):

a) Please confirm that “[s]ignificant uncertainties are associated with the reservoir capacity calculation” underlying the approximate storage capacities of 289 million and 442 million tonnes of CO2 emissions cited in the Guidehouse report.

b) Please confirm that there is a “lack of scientifically sound data to predict a true porosity and permeability” for the formation containing the two potential CSS cites in Ontario.”

c) Please confirm that “one of the major concerns for sequestration is leakage to the atmosphere” and that “occur through abandoned wells” and that:

> “A large number of abandoned and unknown oil wells are present in southwestern Ontario whose status is not well documented. These have been abandoned for the past 20–90 years. There are no updated reports available about the status of cement plugging and its strength. Moreover, the quality and quantity of cement used in the early years might have severely degraded by this time. The reactivity of the injected CO2 (or mixture of gas) with this cement and its consequences needs to be

evaluated. Many of these wells (2500) have no plug end date, which raises questions about their present situation."

d) Please confirm that "[a] detailed investigation is necessary to determine the real status of these wells, their ability to withstand the sequestration pressure and impact on the environment in case of a failure." Please confirm whether Guidehouse included the cost of this investigation in its report.

e) Please confirm that "[u]ncertainties in the reservoir condition during the injection process could lead to an unexpected work load associated with huge cost involvement."

f) Please estimate the "huge cost involvement" described in the above passage from the report cited by Guidehouse. Is this possibility accounted for in the Guidehouse report.

g) Please file a copy of the report in the footnote to the above passage from the Guidehouse report so it can be referred to with an exhibit number. If it is proprietary, please file a copy on a confidential basis.

h) The quote from the Guidehouse report refers to sequestration for "one hundred years to several thousand years." What are the factors that would determine whether the actual amount would be nearer to the top or the bottom of that scale.

<u>Response:</u>

The following response was provided by Guidehouse Canada Ltd.:

(a-c, e) Guidehouse declines to answer this question. Guidehouse has no independent view of the information provided in the referenced study. This topic is not in the scope that Guidehouse studied in this analysis.

d) The cost analysis in the *Pathways to Net Zero Emissions for Ontario* Study does not include costs of an investigation to determine well status prior to CCS. Guidehouse declines to confirm the statement referenced in the question. Guidehouse has no independent view of the information provided in the referenced study. This topic is not in the scope that Guidehouse studied in this analysis.

f) The cost analysis in the *Pathways to Net Zero Emissions for Ontario* Study does not account for unexpected work loads due to uncertainties in reservoir conditions. This topic is not in the scope that Guidehouse studied in this analysis and Guidehouse declines to estimate the costs associated with reservoir condition uncertainties.

g) Guidehouse declines to provide a copy of the referenced report. The requested document is a third party report that Guidehouse paid to access, and Guidehouse does not have permission to reproduce or publish it.

h) The quote from the Guidehouse Report is referenced to the study cited to the *Energy Conversion & Management* journal. Guidehouse has no independent view of the information provided in the referenced study. This topic is not in the scope that Guidehouse studied in this analysis. Guidehouse declines to answer this question.

The following response was provided by Enbridge Gas:

a-e) Enbridge Gas is still evaluating subsurface studies and is optimistic about the feasibility of CCS development in Ontario in conjunction with strong modelling, monitoring and risk management practices underpinned by regulatory and technical standards requirements. The Company will provide more information in future forums.

ENBRIDGE GAS INC.

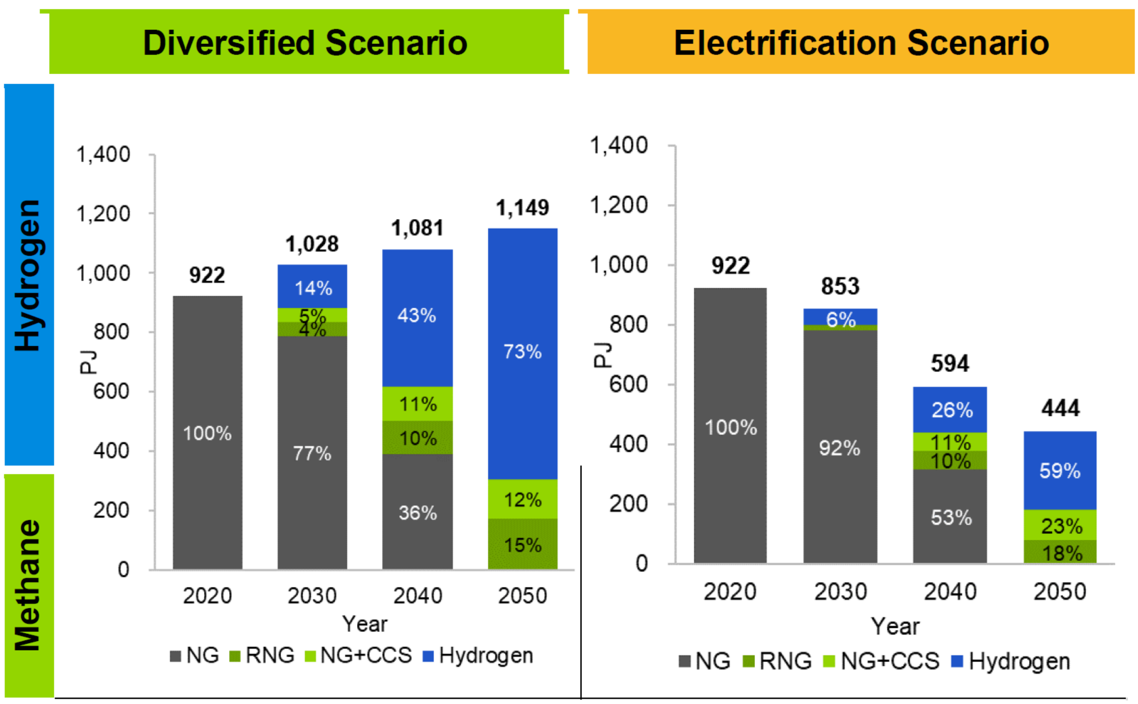
Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 26

Preamble:



Question(s):

a) Please complete the following table. Please provide a response on a best-efforts basis, making assumptions and stating caveats as necessary. Please provide all underlying sources, calculations, and assumptions. Please provide two copies – one in m3/yr and one in PJ/yr.

Consumption of Gaseous Fuels by Scenario and Year					
	2024	2025	2026	2027	2028
Diversified scenario					
Fossil gas					

Renewable natural gas					
Fossil gas with CCS					
Hydrogen derived from fossil gas (i.e. blue)					
Hydrogen derived from electrolysis (i.e. green)					
Electrification scenario					
Fossil gas					
Renewable natural gas					
Fossil gas with CCS					
Hydrogen derived from fossil gas (i.e. blue)					
Hydrogen derived from electrolysis (i.e. green)					

b) Please complete the following table. Please provide a response on a best-efforts basis, making assumptions and stating caveats as necessary. Please provide all underlying sources, calculations, and assumptions. Please provide two copies – one in m3/yr and one in PJ/yr.

Consumption of Gaseous Fuels by Scenario and Decade				
	2020	2030	2040	2050
Diversified scenario				
Fossil gas				
Renewable natural gas				
Fossil gas with CCS				
Hydrogen derived from fossil gas (i.e. blue)				
Hydrogen derived from electrolysis (i.e. green)				
Electrification scenario				
Fossil gas				
Renewable natural gas				
Fossil gas with CCS				
Hydrogen derived from fossil gas (i.e. blue)				
Hydrogen derived from electrolysis (i.e. green)				

c) This question is for Enbridge: Please complete the following table. Please provide a response on a best-efforts basis, making assumptions and stating caveats as necessary. Please provide all underlying sources, calculations, and assumptions. Please provide two copies – one in m3/yr and one in PJ/y.

Forecast Consumption of Gaseous Fuels per Enbridge Application					
	2024	2025	2026	2027	2028
Fossil gas					
Renewable natural gas					
Fossil gas with CCS					

Hydrogen derived from fossil gas (i.e. blue)					
Hydrogen derived from electrolysis (i.e. green)					

Response:

a) The following response was provided by Guidehouse Canada Ltd.:

Guidehouse declines to provide the requested table because the *Pathways to Net Zero Emissions for Ontario* Study modelled gaseous fuel consumption on a decade basis and not for the individual years specified in the requested table.

b) The following response was provided by Guidehouse Canada Ltd.:

Please see tables below.

Table 1 Consumption of Gaseous Fuels by Scenario and Decade (PJ/yr)					
	2020	2030	2040	2050	
Diversified scenario					
Fossil gas	922	772	414	0	/u
Renewable natural gas	0	44	91	170	/u
Fossil gas with CCS	0	48	114	134	/u
Hydrogen derived from fossil gas (i.e. blue)	0	144	288	305	/u
Hydrogen derived from electrolysis (i.e. green)	0	0	178	539	/u
Electrification scenario					
Fossil gas	922	78 7	314	0	/u
Renewable natural gas	0	0	59	72	/u
Fossil gas with CCS	0	0	64	103	/u
Hydrogen derived from fossil gas (i.e. blue)	0	55	151	149	/u
Hydrogen derived from electrolysis (i.e. green)	0	0	0	104	/u

Table 2
Consumption of Gaseous Fuels by Scenario and Decade (million m3/yr)

	2020	2030	2040	2050	
Diversified scenario					
Fossil gas	23,726	19,884v	10,654	0	/u
Renewable natural gas	0	1,134	2,340	4,375	/u
Fossil gas with CCS	0	1,226	2,939	3,450	/u
Hydrogen derived from fossil gas (i.e. blue)	0	11,908	23,822	25,169	/u
Hydrogen derived from electrolysis (i.e. green)	0	0	14,708	44,544	/u
Electrification scenario					
Fossil gas	23,726	20,251	8,095	0	/u
Renewable natural gas	0	0	1,511	1,855	/u
Fossil gas with CCS	0	0	1,649	2,653	/u
Hydrogen derived from fossil gas (i.e. blue)	0	4,534	12,483	12,328	/u
Hydrogen derived from electrolysis (i.e. green)	0	0	0	8,603	/u

c) Enbridge Gas declines to provide forecasted amount for RNG. This issue will be addressed in Phase 2 of the proceeding in accordance with the OEB’s Decision on Issues List dated January 27, 2023.

Enbridge Gas declines to provide forecasts for demand associated with natural gas with CCS and blue hydrogen as forecasts for these low carbon alternatives cannot be reliably estimated at this time, pending the development of further government regulations required to permit these activities within Ontario.

Please see Tables 3 and 4 below for the forecasted amount of gas demand for the 2024 to 2028 period, presented in millions m3/yr and PJ/year respectively. The forecasted volumes for natural gas in line 1 of the tables below represent the general service annual volume forecast as provided in the response to Exhibit I.1.10-STAFF-31 Attachment 1, Table 1 and the throughput volume forecast for the distribution contract market sales and T-service, as provided in the response to Exhibit I.1.10-STAFF-30, Attachment 1. The forecast for hydrogen in line 2 of the tables below reflects the maximum blend percentage of 2 percent by volume for the current area served by the Low Carbon Energy Project Phase (LCEP) Phase 1. The forecast builds on the year 1 actual hydrogen consumption in LCEP Phase 1, but may not fully represent future volumes. The forecast is subject to variability in gas flow in the system where blending is occurring at a rate between 0 to 2 percent and from variability in the hydrogen plant operations. Enbridge Gas is unable to estimate the impacts to the forecast due to LCEP Phase 2 as the blending rate has yet to be established for LCEP Phase 2.

Table 3
Forecast Consumption of Gaseous Fuels per Enbridge Application (millions m3/yr)

Line No.		2024	2025	2026	2027	2028
1	Combined General Service and Contract Volume forecast	27,922.9	28,140.7	28,963.0	28,963.3	28,942.6
2	Hydrogen derived from electrolysis (i.e. green)	0.18	0.18	0.18	0.18	0.18

Table 4
Forecast Consumption of Gaseous Fuels per Enbridge Application (PJ/yr)

Line No.		2024	2025	2026	2027	2028

2	Hydrogen derived from electrolysis (i.e. green)	0.0023	0.0023	0.0023	0.0023	0.0023

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

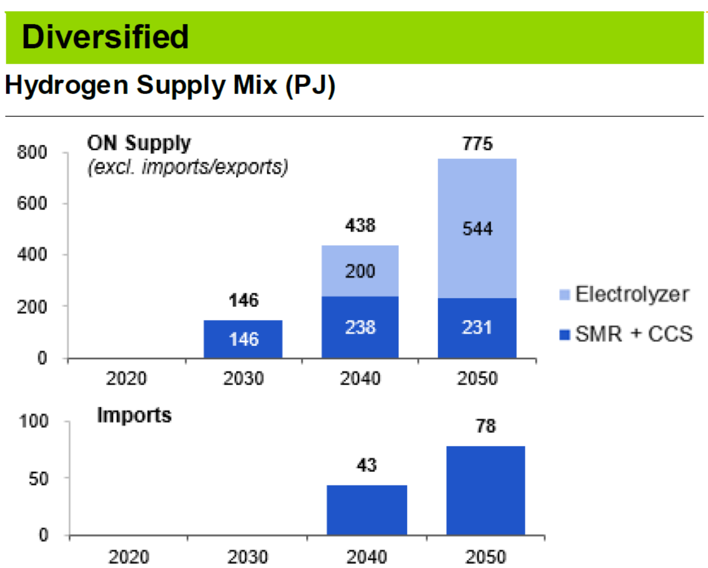
Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 40; CSA Statement on Hydrogen Blending

Preamble:

The following figure appears at page 40 of the Guidehouse report.



The Canadian Standards Organization Statement on Hydrogen Blending reads as follows:

Use of hydrogen and natural gas mixtures in products certified for natural gas in Canada and the US

It has come to our attention that some natural gas utilities in North America have begun to blend, or are planning to blend, hydrogen with natural gas for residential and industrial applications. In the interest of public safety, we are compelled to remind our customers and other stakeholders of the following:

- At present, there are no accepted standards in Canada or the US for fuel burning products using mixtures of natural gas and hydrogen, for either residential or industrial applications

- In the absence of accepted standards, CSA Group does not currently offer certification programs for products and appliances that burn a mixture of natural gas and hydrogen

- CSA Group's current certification programs only apply to products that burn natural gas in accordance with existing accepted standards

- CSA certification of a product is void when it is used outside the parameters of the applicable standards – which would include the use of fuels other than natural gas, such as a mixture of natural gas and hydrogen

CSA Group has been following developments related to the potential use of hydrogen and hydrogen fuel blends in fuel-burning products for many years, and we are currently involved in several research initiatives to study these alternative fuels and their implications. Technical committees within our standards development organization are evaluating potential amendments of the current fuel burning standards to include hydrogen and natural gas mixtures. This evaluation is ongoing and involves a thorough review of supporting evidence.

Research and testing are vital to ensuring that any modifications to the current standards for fuel-burning appliances achieve their core purpose – enabling the safe deployment of products in society. While we are excited by the potential role hydrogen could play in reducing carbon emissions, we feel it is vital that the necessary research and standards development take place before hydrogen-blended fuels are used in products certified solely for natural gas.

It is our hope that, until appropriate standards and certification programs are in place, gas utilities and other suppliers of natural gas will abstain from blending hydrogen with natural gas for use with products only certified for natural gas. We urge utilities, regulatory authorities, certification bodies, and manufacturers of gas appliances to work together to ensure that the use of any mixture of hydrogen and natural gas in natural gas products take place only after the ongoing research is complete, the standards are amended, and products can be certified to the amended standards.

<u>Question(s)</u>:

a) The CSA states as follows: "CSA certification of a product is void when it is used outside the parameters of the applicable standards – which would include the use of fuels other than natural gas, such as a mixture of natural gas and hydrogen." Does Enbridge agree? If not, please explain.

b) In light of the above, please confirm that the CSA certification of the gas equipment in all homes served by Enbridge's hydrogen blending project is void. If not, please explain.

c) Is Enbridge offering compensation to customers whose gas equipment no longer has valid CSA certification due to Enbridge's hydrogen blending pilot? If not, why not?

d) The CSA states as follows: "We urge utilities, regulatory authorities, certification bodies, and manufacturers of gas appliances to work together to ensure that the use of any mixture of hydrogen and natural gas in natural gas products take place only after the ongoing research is complete, the standards are amended, and products can be certified to the amended standards." Will Enbridge abide by this request from the CSA? If not, why not?

e) When did Enbridge first become aware of this CSA statement?

f) When Enbridge first became aware of this CSA statement, did it consider halting its hydrogen blending pilot, for example, on the basis that it would be voiding the CSA certification of its customers' gas equipment?

g) What are the consequences for a consumer with gas equipment that without valid CSA certification?

<u>Response:</u>

a-c,g) Enbridge Gas recognizes that the constituents and resulting quality of 'natural gas' are inherently variable due to the interconnected nature of the North American gas grid which draws on multiple sources of production and imports. Under the *Technical Standards and Safety Act, 2000, S.O. 2000, c.16 (TSSA), Ontario Regulation 210/01, Oil and Gas Pipeline Systems,* the term "gas" 'means any gas or mixture of gases suitable for domestic or industrial fuel that is conveyed to the user through a pipeline.' Similarly, the *OEB's* definition of "gas" 'means natural gas, substitute natural gas, synthetic gas, manufactured gas, propane-air gas or any mixture of any of them.'[1] As such, small amounts of hydrogen may be part of the natural gas mixture and continue to fall within the parameters of CSA's test gas for appliance certification.

---

[1] Ontario Energy Board Act, 1998, S.O. 1998, c.15, Sched. B (OEB). https://www.ontario.ca/laws/statute/98o15/v49

In the OEB's approval of Enbridge Gas's hydrogen blending project the OEB found that the TSSA's review of Enbridge Gas's risk assessment led to its conclusion that at the low levels of hydrogen proposed in the pilot, there is no significant risk to the distribution system, Enbridge Gas's customers or their equipment.[2] To date, Enbridge Gas has not had any customer reports of any component or appliance failure since the inception of the project. Enbridge Gas also indicated in that proceeding:

> *Enbridge Gas's research concludes that the maximum 2% hydrogen blend by volume does not cause a material change to the combustion parameters of the gas that has been distributed within the BGA. Enbridge Gas research indicates that the risk associated with hydrogen blending in the BGA is acceptable. Any instance of appliance failure or failure of appliance components would more likely be attributable to wear and tear or lack of maintenance. In the unlikely event that it is determined that the hydrogen content of the blended gas delivered in the BGA caused the failure of components or appliances the Company would compensate the affected customer.*[3]

Enbridge Gas cannot comment on the voidance of a CSA certification. The confirmation of whether appliances are void of CSA certification would be determined by CSA. The consequences to a consumer would be determined by the appliance manufacturer.

d- f) Enbridge Gas first became aware of this CSA statement on November 22, 2022. Enbridge Gas continues to operate its hydrogen blending pilot as approved by the OEB and its technical regulator, the Technical Standards and Safety Authority (TSSA). Enbridge Gas has also been working with the CSA 's Technical Committee team, on developing standards for higher levels of hydrogen blending.

There are ongoing discussions with CSA Technical Committee team that Enbridge Gas is part of, and that has representation from gas utilities, regulatory authorities, certification bodies, manufacturers of gas appliances, and research organizations. To date discussions have included; perspectives of CSA position on their November 22 statement, and working together to find ways for the CSA to evolve their position. Enbridge Gas has shared research and testing data for both low level blending and higher levels of hydrogen blending. Enbridge Gas is advancing the position that low levels of hydrogen up to 5% results in gas that essentially acts as natural gas, recognizing that the existing natural gas composition is inherently variable. Enbridge Gas does not believe that new standards are required for low level blending of hydrogen, but does agree that hydrogen blends above 5% may require updated standards, including different standards for blending at higher levels of 20-30% (and

for 100% hydrogen). Enbridge Gas is committed to working with the CSA to support the development of updated standards.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

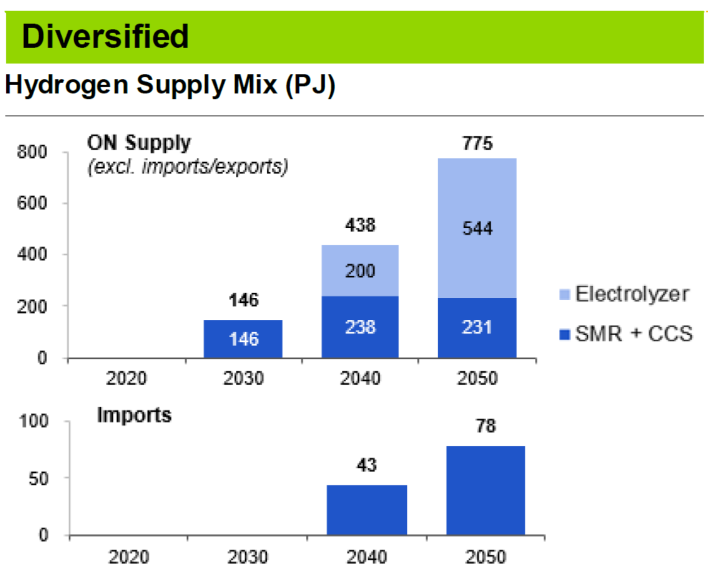
Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 40

Preamble:

The following figure appears at page 40 of the Guidehouse report.



Question(s):

a) Please complete the following table with details regarding the use of hydrogen under the two scenarios:

Hydrogen Consumption by Scenario				
	2020	2030	2040	2050
Diversified scenario				
Hydrogen consumption (m3/yr)				
Hydrogen consumption at 100% H2 concentration (m3/yr)				

Hydrogen consumption in a hydrogen/methane blend (m3/yr)				
Maximum hydrogen concentration (%, by volume)				
Maximum hydrogen concentration (%, by energy value)				
Electrification scenario				
Hydrogen consumption (m3/yr)				
Hydrogen consumption at 100% H2 concentration (m3/yr)				
Hydrogen consumption in a hydrogen/methane blend (m3/yr)				
Maximum hydrogen concentration (%, by volume)				
Maximum hydrogen concentration (%, by energy value)				

b) Please provide a copy of the above table with the m3/yr figures replaced by PJ/yr.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Please see Table 1, with hydrogen consumption in terms of billion m3 per year.

Table 1
Hydrogen Consumption by Scenario

	2020	2030	2040	2050	
Diversified scenario					
Hydrogen consumption (billion m3/yr)	0	11.9	38.5	69.7	/u
Hydrogen consumption at 100% H2 concentration (billion m3/yr)	0	11.9	35.5	68.4	
Hydrogen consumption in a hydrogen/methane blend (billion m3/yr)	0	0	3	1.4	
Maximum hydrogen concentration (%, by volume)	0.0%	0.0%	19.2%	20.0%	
Maximum hydrogen concentration (%, by energy value)	0.0%	0.0%	6.0%	6.3%	
Electrification scenario					
Hydrogen consumption (billion m3/yr)	0	4.5	12.5	20.9	/u
Hydrogen consumption at 100% H2 concentration (billion m3/yr)	0	4.5	11.1	20	/u

Table 1 (Continued)
Hydrogen Consumption by Scenario

	2020	2030	2040	2050
Hydrogen consumption in a hydrogen/methane blend (billion m3/yr)	0	0	1.4	1
Maximum hydrogen concentration (%, by volume)	0.0%	0.0%	6.4%	20.0%
Maximum hydrogen concentration (%, by energy value)	0.0%	0.0%	2.0%	6.3%

b) Please see Table 2, with hydrogen consumption in terms of PJ per year.

Table 2
Hydrogen Consumption by Scenario

	2020	2030	2040	2050	
Diversified scenario					
Hydrogen consumption (PJ/yr)	0.0	144.2	466.5	843.9	/u
Hydrogen consumption at 100% H2 concentration (PJ/yr)	0.0	144.2	429.9	827.5	/u
Hydrogen consumption in a hydrogen/methane blend (PJ/yr)	0.0	0.0	36.6	16.4	/u

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

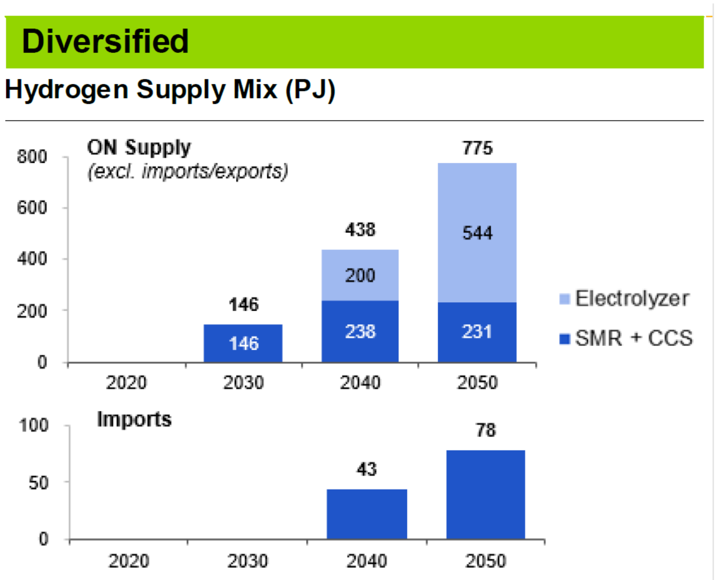
Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 40

Preamble:

The following figure appears at page 40 of the Guidehouse report.



Question(s):

a) What percentage of hydrogen blending has been confirmed to be safe? Please explain and provide references. Please provide the response both in terms of percent by volume and percent by energy value.

b) The California Public Utilities Commission concluded as follows:

> "Relative to injecting and blending hydrogen into the natural gas pipeline, leaks and losses of hydrogen gas are two important considerations. Leaks are of high importance for safety reasons particularly in confined spaces, while losses are more relevant to storage and economics. Leaks in the distribution natural gas system, comprised of plastic pipelines are expected to occur primarily by

hydrogen permeation, while the majority of leaks in the transmission system and distribution system comprised of metal pipelines are expected to occur through cracks, joints, seals, or threads [2]. The findings of the experimental work conducted by this project on controlled leaks through orifices, suggest that volumetric gas blend leak flow rate increases with increase in concentration of hydrogen gas in the blend …

Based on a recently published report, there is literature available for the lower blending percentage (1-2% per volume). Beyond 2%, the literature starts to show gaps in areas such as ‘inspection and maintenance’ and ‘underground gas storage’.”[1]

Does Guidehouse agree that the safety of hydrogen blending at percentages beyond 2% has not yet been conclusively established due to remaining gaps in the literature?

c) The California Public Utilities Commission concluded as follows:

Under the assumption of viscous turbulent flow for gas leaks in the natural gas pipeline system, originating from joints, threads, cracks, and pinhole defects, gas blends of hydrogen and methane would leak at a higher volumetric flow rates compared to pure methane, under the same conditions. The increase of flow rate is inversely proportional to the square root of the specific gravity of the hydrogen/methane gas blend. Thus for a gas blend containing 10% hydrogen the expected increase in flow rate is 5% compared to pure methane, while for 20% hydrogen gas blend the increase in leak flow rate is 10%.[2]

Does Guidehouse or Enbridge have any reason to disagree with that conclusion?

d) The California Public Utilities Commission concluded as follows:

The lower energy content of hydrogen gas compared to methane, means that a volume of hydrogen more than three times that of methane is necessary to deliver the same amount of energy. Therefore, without any changes in the natural gas transmission and distribution pipeline system, larger operating pressures may be required with hydrogen- methane gas blends to deliver the same amount of energy comparable to pure methane. Increasing operating pressure would result in increased leak flow rates. Thus any changes to

[2] The California Public Utilities Commission, Final Report, *Hydrogen Blending Impacts Study*, Prepared by: University of California, Riverside, July 18, 2022, p. 37 (link).

operating gas pressure should consider gas leak rates, among other factors, such as integrity of the system.[3]

Does Guidehouse or Enbridge have any reason to disagree with that conclusion?

e) The California Public Utilities Commission concluded as follows:

> Hydrogen gas has significantly broader flammability range, much lower ignition energy, and higher flame velocity compared to natural gas.[4]

Do Guidehouse and Enbridge agree? If not, why not.

f) Please provide a table comparing the flammability range, ignition energy, and flame velocity of hydrogen and methane.

Response:

a-b) No two gas distribution systems are the same. Hydrogen blending requires that a case-by-case engineering assessment be conducted to ensure system compatibility with hydrogen in consideration of the unique circumstances of each blended gas area. Reports[5,6] issued by the Canadian Gas Association (CGA) and American Gas Association (AGA) as well as California Public Utilities Commission (CPUC) suggest that hydrogen blending may be possible at varying concentrations, including at concentrations above 2%. The CPUC concludes the following: "Providing that the hydrogen blend is homogeneous, it was reported that the addition of 10% hydrogen to a typical natural gas blend, does not impose significant impacts to the gas quality, materials, network capacity, safety or risk aspects"[7]

Enbridge Gas's proposed Hydrogen Blending Grid Study, amongst other objectives, seeks to identify safe limits for hydrogen as it applies to Enbridge Gas's systems and customers. Please see Exhibit 4, Tab 2, Schedule 6, pages 16 to 17.

[6] Enabling Higher-Hydrogen Blending in the Natural Gas Distribution System, October 2022, https://www.cga.ca/wp-content/uploads/2022/10/CGA-Hydrogen-Blending-Greater-than-5.pdf
[7] The California Public Utilities Commission, Final Report, Hydrogen Blending Impacts Study, July 18, 2022, p.108. https://docs.cpuc.ca.gov/PublishedDocs/Efile/G000/M493/K760/493760600.PDF

The following response was provided by Guidehouse Canada Ltd.:

Guidehouse has not independently evaluated the safety of hydrogen blending in natural gas pipelines. In developing scenario assumptions for the P2NZ Study, Guidehouse relied on secondary research to determine blending limits for hydrogen. The CPUC study referenced in the question notes multiple successful ongoing efforts to blend hydrogen at levels about 5% by volume, including successful long-term blending at levels of 10-12% by volume by Hawaii Gas, and successful pilots with 20% blending by volume in France, the Netherlands, and England.[8] Other studies also support assumptions of gradually higher blend levels, including a 2019 report from French gas infrastructure operators, which cites a 20% by volume blending threshold as the level of hydrogen blending above which significant investment will be needed.[9] Additional studies of hydrogen blending are underway in the UK, including National Grid's FutureGrid project that will study whether the National Transmission System will be able to tolerate higher concentrations of hydrogen, up to 100%.[10] The US National Renewable Energy Laboratory published a review of active blending projects in gas transmission networks.[11] For the purposes of the P2NZ Study, Guidehouse assumed that blending hydrogen in natural gas supplies at rates of 20% by volume was a reasonable blending limit for the report scenarios.

c) Enbridge Gas is not privy to the efficacy of the calculations used to arrive at the relations presented in the CPUC report; however, Enbridge Gas recognizes that engineering assessments for pipeline systems are important to identify sources of potential leaks and modifications to reduce and/or eliminate them. Within the CPUC report, other studies referenced indicate identical leak rates for hydrogen and methane under some conditions. One must read beyond the portion of text provided in the question to see the full conclusion of the CPUC which states:

> Despite the increase of total volumetric gas flow rate with the blending of hydrogen with natural gas, the overall methane emissions would decrease, while the overall energy loss due to leaks would remain relatively unchanged due to the lower energy density of hydrogen compared to methane.

> Even if majority of hydrogen-natural gas blend leaks can be attributed to permeation or viscous flow, which both result in larger volumetric flow rates with increased concentration of hydrogen in the gas blend, other leak mechanisms should be considered.[12]

A study by the European Commission Joint Research Union (JRC), reported on a study by Sandia National Laboratories which, points out in its findings that:

> The volumetric flowrate of hydrogen is higher than for methane at fixed pressure. In contrast, mass and energy flow rate of methane are higher than hydrogen at fixed pressure. Figure 22 b) shows that volumetric flow rate of hydrogen, [depicted in blue], is about three times that of the methane for an equivalent leak. However, the mass flow of hydrogen is significantly lower. This means that the leak rate is substantially lower on a mass basis for hydrogen due to the lower density of hydrogen vs methane.[13]

Leaks can exhibit a range of turbulent, laminar or mixed-flow regimes. A component of Enbridge Gas's Grid Study is for the proposed Grid Study's Engineering assessment to identify potential impact to leak rates in pipeline systems with a hydrogen-blended gas and recommend any necessary modifications.

The following response was provided by Guidehouse Canada Ltd.:

Guidehouse declines to answer these questions, as Guidehouse has not independently studied the leak flow rates of hydrogen-blended natural gas.

d) Natural gas pipeline systems in Ontario are regulated by the Technical Standards and Safety Authority (TSSA) who has adopted the CAN/CSA Z662 Oil and Gas Pipeline Systems standard. Under this standard, a change in service fluid, which would include the addition of blended hydrogen, requires that an engineering assessment be conducted. The assessment must consider a multitude of factors including the potential for gas leaks, impact on system integrity and management systems, and risk assessments. Please also see response at Exhibit I.1.4.2-ED-127 parts b-e).

The following response was provided by Guidehouse Canada Ltd.:

Guidehouse declines to answer these questions, as Guidehouse has not independently studied the leak flow rates of hydrogen-blended natural gas.

e) Enbridge Gas agrees that pure hydrogen has different thermodynamic properties compared to pure methane; however, it is important to note that low blends of hydrogen in natural gas do not differ significantly in behaviour compared to pure natural gas. This is shown in response at part f) and c).

The following response was provided by Guidehouse Canada Ltd.:

Guidehouse declines to answer these questions, as Guidehouse has not independently studied the flammability ranges of hydrogen-blended natural gas.

f) It should be noted that natural gas may contain varying constituents that would affect its thermodynamic properties. In particular, flame velocity and combustion are dependent on numerous parameters such as fuel composition, fuel gas pressure, fuel-air ratio, combustion method, etc. Table 1 provides the following information from H2 Tools comparing pure hydrogen to pure methane in tabular form.

The following response was provided by Guidehouse Canada Ltd.:

Guidehouse declines to answer these questions, as Guidehouse has not independently studied the flammability ranges of hydrogen-blended natural gas.

Table 1
Comparison of Pure Hydrogen to Pure Methane[14]

Property	Units	Hydrogen	Methane
Chemical Formula		H_2	CH_4
Molecular Weight [a, b]		2.02	16.04
Density, NTP [3, a, c]	kg/m³	0.0838	0.668
	lb/ft³	0.00523	0.0417
Viscosity, NTP [3, a, b]	g/cm-sec	8.81 E-5	1.10 E-4
	lb/ft-sec	5.92 E-6	7.41 E-6
Normal Boiling Point [a, b]	°C	-253	-162
	°F	-423	-259
Vapor specific gravity, NTP [3, a, d]	air = 1	0.0696	0.555
Flash Point [b, d]	°C	<-253	-188
	°F	<-423	-306
Flammability Range in Air [c, b, d]	vol%	4.0 - 75.0	5.0 - 15.0
Auto ignition temperature [b, d]	°C	585	540
	°F	1085	1003
Maximum flame velocity in air [2, c]	m/s	2.83	0.45
	ft/s	9.28	1.48

Notes:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 43

Preamble:

These questions relate to the costing of the scenarios.

Question(s):

a) Please complete the following tables with the average and marginal cost assumptions underlying Guidehouse's analysis of the two scenarios:

Commodity, Transmission, and Distribution Cost Assumptions – Diversified Scenario				
	2020	2030	2040	2050
Electricity – Average Cost				
Energy cost ($/MWh)				
Capacity cost ($/MW)				
Transmission & distribution ($/MW)				
Electricity – Marginal Cost				
Energy ($/MWh)				
Capacity ($/MW)				
Transmission & distribution ($/MW)				
Fossil gas – Average Cost				
Commodity ($/PJ)				
Transmission & distribution ($/PJ/hr)				
Fossil gas – Marginal Cost				
Commodity ($/PJ)				
Transmission & distribution ($/PJ/hr)				
Fossil gas with CCS – Average Cost				
Commodity ($/PJ)				
CCS process ($/PJ)				
Transmission & distribution ($/PJ/hr)				
Fossil gas with CCS – Marginal Cost				
Commodity ($/PJ)				
CCS process ($/PJ)				

Transmission & distribution ($/PJ/hr)				
RNG – Average Cost				
Commodity ($/PJ)				
Transmission & distribution ($/PJ/hr)				
RNG – Marginal Cost				
Commodity ($/PJ)				
Transmission & distribution ($/PJ/hr)				
Green Hydrogen – Average Cost				
Commodity ($/PJ)[1]				
Transmission & distribution ($/PJ/hr)				
Green Hydrogen – Marginal Cost				
Commodity ($/PJ) [2]				
Transmission & distribution ($/PJ/hr)				
Blue Hydrogen – Average Cost				
Commodity ($/PJ)[3]				
Transmission & distribution ($/PJ/hr)				
Blue Hydrogen – Marginal Cost				
Commodity ($/PJ) [4]				
Transmission & distribution ($/PJ/hr)				

Commodity, Transmission, and Distribution Cost Assumptions – Electrified Scenario				
	2020	2030	2040	2050
Electricity – Average Cost				
Energy cost ($/MWh)				
Capacity cost ($/MW)

c) Please describe how each of the figures in (b) was derived, including any relevant sources.

Response:

The following response was provided by Guidehouse Canada Ltd.:

The purpose of the P2NZ analysis was to forecast the demand for different energy types based on two plausible scenarios to achieve net zero emissions in 2050, and to estimate the total energy system costs that would be required to transition Ontario's energy system to supply the energy demand forecast for each scenario. The P2NZ analysis was conducted to estimate total system costs, and not to forecast energy prices, commodity costs, or average or marginal costs of production, transmission, and distribution.

Guidehouse declines to complete the tables as specified in a) and b) because few of the data points requested are available as outputs from the P2NZ analysis. Guidehouse is unable to provide per-unit energy cost estimates for electricity, methane, or hydrogen because Guidehouse's approach to modeling did not forecast or determine the average or marginal costs of different energy sources in Ontario. Similarly, Guidehouse is unable to provide commodity costs, because Guidehouse's approach to cost modeling did not determine commodity costs for RNG or hydrogen on a $/PJ basis. Instead, Guidehouse accounted for the cost of these fuels by (1) determining the required production capacity by decade, (2) estimating the capital costs of developing new production capacity, and (3) estimating the fixed and variable O&M costs of using this capacity to produce RNG and hydrogen.

The sections below highlight the requested data points that are available from the study.

[12] Including the SMR process, CCS process, and transportation to Ontario if that is applicable and not included in the transmission and distribution row below.

a) For natural gas prices, Table A-1 of the P2NZ Report provides the natural gas price forecast used in the P2NZ analysis.

   Table A-11 of the P2NZ Report describes the capital and O&M costs assumed for RNG and hydrogen production technologies in 2030, 2040, and 2050.

   The P2NZ analysis estimated the total cost of intraregional and interregional gas and electric transmission but did not calculate average or marginal T&D costs. Please see response at Exhibit I.1.10-GEC-20, Attachment 1 for details on interregional transmission cost estimates.

b) For a breakdown of annual energy demand by energy source and by decade for the Diversified and Electrification scenarios, please see response at Exhibit I.1.10-SEC-26 Attachment 1, page 2."

   Projected peak demand for methane fuel and hydrogen fuel in aggregate are provided in P2NZ report Figure 15, subheading "Gas Energy Peak Demand (TJ/hour)." However, the LCP model does not break out capacity demand for methane into natural gas and RNG, nor does it provide capacity demand for hydrogen disaggregated to blue hydrogen and green hydrogen.

c) Guidehouse did not compile a single repository spreadsheet of inputs. Please see Appendix A of the P2NZ Report for a detailed description of input data used and data sources referenced in the P2NZ Study.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

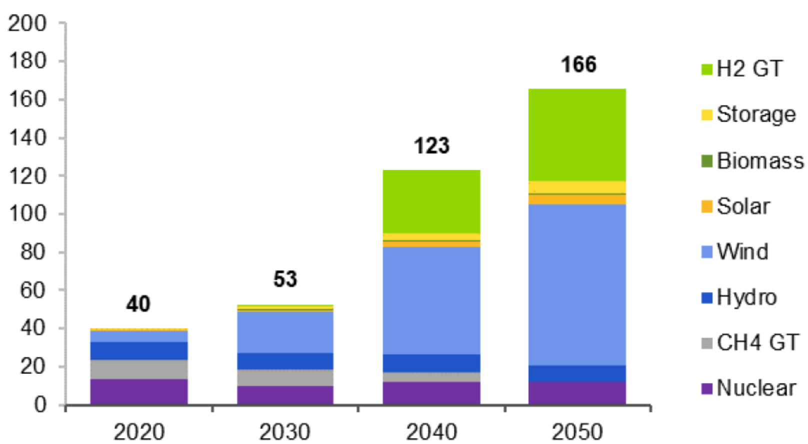
Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 36

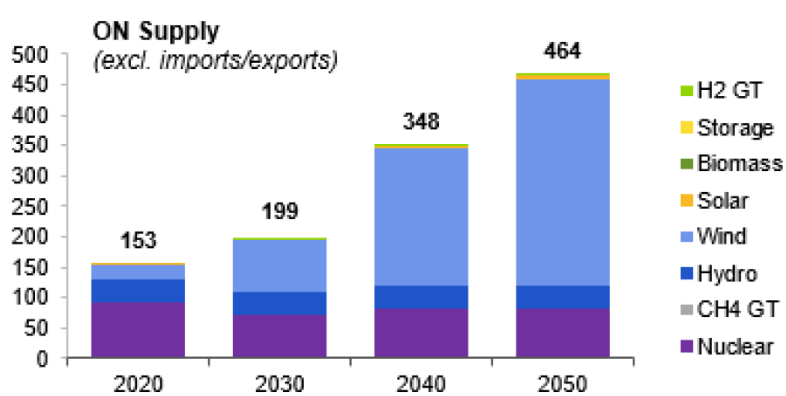
Preamble:

Electrification

Electricity Supply Capacity (GW)



Electricity Supply Mix (TWh)



Question(s):

a) Please complete the following table detailing the cost of the electricity supply resources listed above. If they differ between each, please complete one table per scenario.

Cost of Electricity Supply Resources				
	2020	2030	2040	2050
Resource 1 … n				
LUEC ($/MWh)				
Energy ($/MWh)				
Capacity ($/MW, levelized)				
…				

b) Guidehouse includes a large amount of hydrogen generation capacity starting in 2040. Please explain this? Is that because Guidehouse assumes hydrogen generation to be cheaper than all other alternatives? If yes, please explain, including via a comparison with the cost of storage.

c) Why did Guidehouse not include demand response as a resource?

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) The Guidehouse analysis did not calculate levelized unit electricity costs (LUEC) for different electric generating resources. Instead, the Low Carbon Pathways model accounts for the capital cost of installing the resource (the cost of new resource, or CONE) and the fixed and variable operations & maintenance costs (FOM and VOM) associated with using each generation resource. Table A-11 of the *Pathways to Net Zero Emissions for Ontario* Study contains the CONE, FOM, and VOM assumptions for all of the modeled resources. The CONE, FOM, and VOM assumptions are the same for the core Electrification and Diversified scenarios.

b) In the *Pathways to Net Zero Emissions for Ontario* Study, the Electrification scenario assumes that new hydrogen-fired gas turbine generators will be installed between 2030 and 2040 to serve as a peaking resource to deal with the sharp increase in electric system peak demand resulting from the electrification of space heating and other end uses assumed in that scenario. Hydrogen gas turbines have advantages compared to other available peaking resources (e.g., batteries, pumped hydro, and natural gas turbines), in that they produce zero carbon emissions, they have long duration and high capacity storage options, and they can be installed in a variety of topographies.

c) At the time of the analysis, the Low Carbon Pathways model did not include explicit modeling of demand response measures as a feature. Guidehouse implicitly account for the impact of demand response in the transportation sector when developing the demand forecasts. Guidehouse estimated that the managed charging of electric vehicles will be an impactful demand response measure that will shape the hourly electric load profile of the transportation sector. To implicitly account for the impact of demand response, the analysis used separate electric load shapes for the buildings and transportation sectors that do not have coincident peaks.

Energy efficiency				
Energy (MWh)				

Capacity (MW)				
Demand response				
Energy (MWh)				
Capacity (MW)				

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Tables 1 and 2 show the potential energy and capacity from the following incremental non-emitting resources for each scenario. Guidehouse declines to provide values for demand response, vehicle-to-grid (V2G) storage, and energy efficiency. At the time of the analysis, the Low Carbon Pathways model did not include explicit modeling of demand response measures as a feature. Guidehouse implicitly accounted for the impact of demand response in the transportation sector when developing the demand forecasts. Guidehouse estimated that the managed charging of electric vehicles will be an impactful demand response measure that will shape the hourly electric load profile of the transportation sector. To implicitly account for the impact of demand response, the analysis used separate electric load shapes for the buildings and transportation sectors that do not have coincident peaks. V2G technologies were out of scope for this study, so Guidehouse cannot provide energy and capacity values for these resources. For energy efficiency, Guidehouse modeled the impacts of energy efficiency improvements, but did not explicitly model energy efficiency as an electricity resource.

Table 1
Diversified Scenario: Electricity Resource Potential – Energy and Capacity

	2020	2030	2040	2050	
Wind					
Energy (MWh)	22,610,240	84,285,760	175,416,914	307,794,888	/u

ENBRIDGE GAS INC.

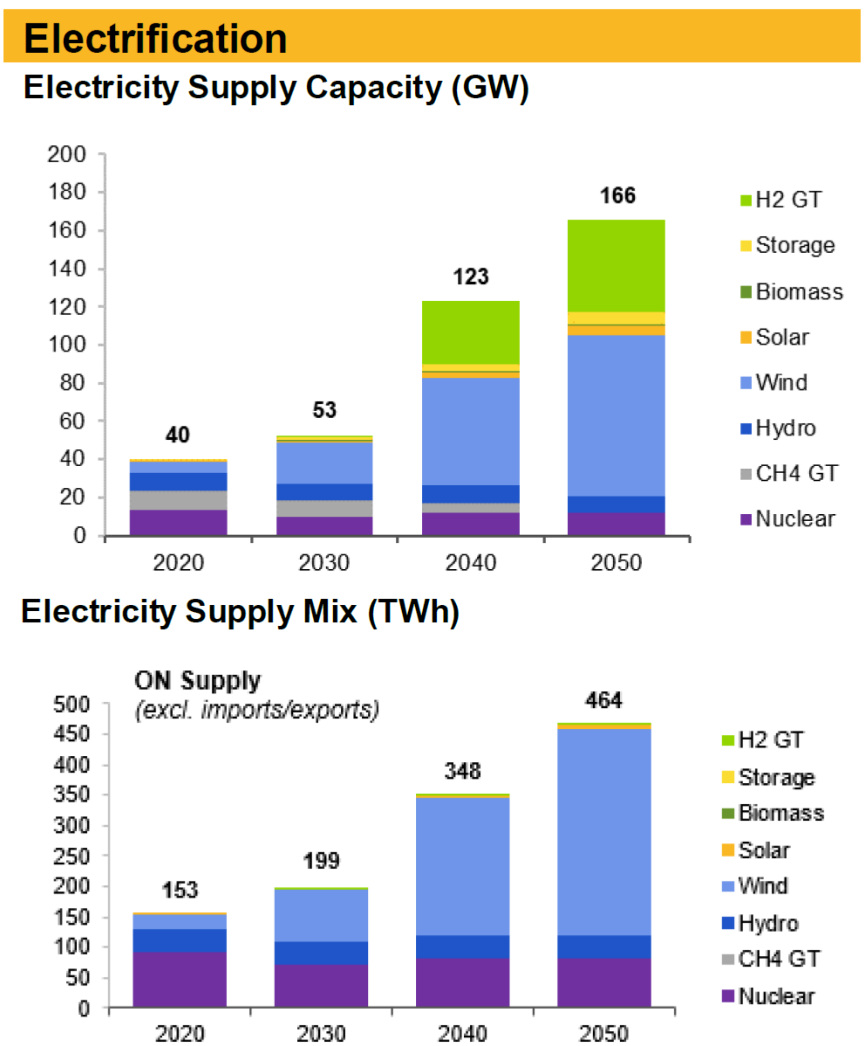
Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 36

Preamble:



Question(s):

a) How did Guidehouse determine the load factor for (i) all electricity consumption, (ii) EVs, and (iii) space heating, and (iv) water heating.

b) Please complete the following table showing the forecast load factor for all electricity consumption:

Electricity Load Factor				
	2020	2030	2040	2050
Diversified				
Energy demand (MWh)				
Capacity demand (MW)				
Load factor				
Electrified				
Energy demand (MWh)				
Capacity demand (MW)				
Load factor				

c) Please complete the following table showing the load factor for EVs.

Electric Vehicle Load Factor				
	2020	2030	2040	2050
Diversified				
Energy demand (MWh)				
Demand at system peak (MW)				
Load factor				
Electrified				
Energy demand (MWh)				
Demand at system peak (MW)				
Load factor				

d) Please complete the following table showing the electric load factor for space and water heating.

Electric Load Factor for Space and Water Heating				
	2020	2030	2040	2050
Diversified				

Energy demand (MWh)				
Demand at system peak (MW)				
Load factor				
Electrified				
Energy demand (MWh)				
Demand at system peak (MW)				
Load factor				

e) If possible, please reproduce (g) with a breakdown between space and water heating. If that is not possible, please provide a rough estimate of the contribution of each (%) to the overall space and water heating load.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Guidehouse did not calculate a load factor for overall electricity use or for individual end uses of electricity. The process for determining annual electricity use and peak load is as follows:

   i. For each sector included in the analysis (i.e., buildings, transportation, and industry), Guidehouse forecast the annual electricity consumption based on reference case IESO APO forecasts, with interventions to model increased energy efficiency, electrification, and technology switching (i.e., electric resistance space heating changing to electric heat pump).

   ii. Guidehouse developed electric load shape profiles for each sector for each decade and used these load shapes to distribute annual electricity consumption on an hourly basis for each sector. The load shape profiles for the buildings and transportation sectors are different for each decade of the analysis, reflecting the electrification that is assumed to occur in those sectors.

   iii. Guidehouse summed the demand for all sectors in each hour to determine total hourly electric demand.

   iv. Guidehouse identified the hour of peak coincident electricity demand in each decade and referenced each sector's contribution to coincident peak electric demand in those hours.

b) Table 1 describes total annual electricity use and peak electricity demand for all sectors. Guidehouse declines to provide economy-wide electricity load factors because Guidehouse did not calculate them in the demand model.

Table 1

Total Electricity Use					
	2020	2030	2040	2050	
Diversified					
Annual Electricity Demand (TWh)	135.1	184.2	230.3	280.4	/u
Capacity demand (MW)	21,525	32,421	42,565	51,057	/u
Electrification					
Annual Electricity Demand (TWh)	135.1	205.8	327.8	413.3	/u
Capacity demand (MW)	21,525	37,965	68,283	82,143	/u

c) Table 2 describes annual electricity use and peak electricity demand for the transportation sector. Guidehouse declines to provide load factors for the transportation sector or for EVs specifically, because Guidehouse did not calculate them in the demand model. Note that the transportation sector's contribution to peak demand is influenced by the hour in which coincident peak demand occurs. In the Diversified Scenario, the electric peak hour shifts to the late evening in 2050 due to transportation electrification. /u

Table 2

Transportation Sector Electricity Use					
	2020	2030	2040	2050	
Diversified					
Annual Electricity Demand (TWh)	0.0	24.6	51.4	80.1	
Demand at system peak (MW)	0	4,064	3,984	12,870	/u
Electrification					
Annual Electricity Demand (TWh)	0.0	37.2	78.3	122.7	
Demand at system peak (MW)	0	3,208	6,826	10,794	/u

d) Table 3 describes annual electricity use and coincident peak electricity demand for the buildings sector. Guidehouse declines to provide load factors for the buildings sector because Guidehouse did not calculate them in the demand model. Guidehouse notes that Figure 26 of the P2NZ report presents peak demand specific to the buildings sector load, which is a different value than the buildings sector contribution to coincident peak load depicted below. The response at Exhibit I.1.10-ED-74 describes the system peak hours in each decade for each scenario and illustrates that the peak hour changes over time in the Diversified scenario due to the /u /u changing saturation of electric vehicles and electrification of building heat.

Table 3

Buildings Sector Electricity Use					
	2020	2030	2040	2050	
Diversified					
Annual Electricity Demand (TWh)	98.6	118.0	134.2	141.3	/u
Demand at system peak (MW)	15,713	21,990	32,333	29,704	/u
Electrification					
Annual Electricity Demand (TWh)	98.6	125.8	172.4	187.2	/u
Demand at system peak (MW)	15,713	28,682	52,248	59,730	/u

e) Guidehouse assumes that the question refers to sub-part (d) instead of sub-part (g) as stated. Table 4 describes forecast electricity consumption for space heating and water heating end uses, by decade, for both scenarios. Guidehouse declines to provide peak electricity demand or load factors for these individual end uses because Guidehouse did not calculate them in the demand model.

Table 4

Buildings Sector Space Heating and Water Heating Electricity Use					
	2020	2030	2040	2050	
Diversified					
Space Heating Annual Electricity Demand (TWh)	16.6	31.3	38.8	35.1	/u
Water Heating Annual Electricity Demand (TWh)	4.4	4.5	4.9	9.2	/u
Electrification					
Space Heating Annual Electricity Demand (TWh)	16.6	35.2	55.0	55.9	/u
Water Heating Annual Electricity Demand (TWh)	4.4	4.5	15.1	20.3	/u

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 36

Preamble:

These questions relate to Guidehouse's calcualtion of annual and peak electricity demand arising from space conditioning and water cooling in different scenarios.

Question(s):

a) Please complete the following table regarding residential space and water heating equipment in each scenario. If we are missing different kinds of systems, please add those.

Residential Space and Water Heating Equipment				
	2020	2030	2040	2050
Number of customers

Gas heat pump				
Other				
Fully electrified				

b) Please provide the following assumptions as used in Guidehouse's estimate of the impact of residential space and water heating options on electricity demand (both energy (kWh) and peak demand (kW)). Where no assumption was explicitly made, please provide the implied value based on the analysis inputs and outputs. If the numbers change over time, please provide those (at least with the granularity of each decade).

i. Average home demand for space heating at the time of the electricity system peak hour (BTU or kW of heat);
ii. Average home hot water demand at the time of the electricity system peak (BTU or kW);
iii. Average or design day outdoor temperature at the time of the electricity system peak hour;
iv. For the average home with fully electric heat pump space and water heating:
    A. Size of ASHP (BTU);
    B. Size of resistance backup (kW);
    C. Seasonal COP of ASHP (region 5):
    D. COP of ASHP at time of electricity system winter peak hour;
    E. HWHP COP;
    F. Contribution to electricity system winter peak hour for space/water heating without accounting for diversity / coincidence (kW);
    G. Coincidence factor for heating;
    H. Contribution to electricity system winter peak hour for space/water heating after accounting for diversity / coincidence (kW);
    I. Breakdown of contribution to winter peak hour by space and water heating, with and without accounting for coincidence/diversity;

J. Annual electricity demand for heating (kWh);
K. SEER of the ASHP for cooling;
L. COP of ASHP cooling at time of electricity system summer peak hour;
M. Coincidence factor for cooling;
N. Contribution to electricity system summer peak hour with and without accounting for coincidence / diversity(kW);
O. Annual electricity demand for cooling (kWh);

v. For the average home with a hybrid system;
   A. Size of ASHP (BTU);
   B. Seasonal COP of ASHP (region 5):
   C. COP of ASHP at time of electricity system winter peak hour;
   D. HWHP COP;
   E. Contribution to electricity system winter peak hour for space/water heating without accounting for diversity / coincidence (kW);
   F. Coincidence factor for heating;
   G. Contribution to electricity system winter peak hour for space/water heating after accounting for diversity / coincidence (kW);
   H. Breakdown of contribution to winter peak hour by space and water heating, with and without accounting for coincidence/diversity;
   I. Annual electricity demand for heating (kWh);
   J. SEER of the ASHP for cooling;
   K. COP of ASHP cooling at time of electricity system summer peak hour;
   L. Coincidence factor for cooling;
   M. Contribution to electricity system summer peak hour with and without accounting for coincidence / diversity(kW);
   N. Annual electricity demand for cooling (kWh);

vi. For the average home with gaseous only heating:
   A. Size of GHP (BTU);
   B. Seasonal COP of GHP (region 5):
   C. COP of GHP at time of electricity system winter peak hour;
   D. Contribution to electricity system winter peak hour for space/water heating without accounting for diversity / coincidence (kW);
   E. Coincidence factor for heating;
   F. Contribution to electricity system winter peak hour for space/water heating after accounting for diversity / coincidence (kW);
   G. Annual electricity demand for heating (kWh);
   H. SEER of the air conditioner for cooling;
   I. Coincidence factor for cooling;
   J. Contribution to electricity system summer peak hour with and without accounting for coincidence / diversity(kW);
   K. Annual electricity demand for cooling (kWh);

c) Please provide all details, calculations, assumptions, and spreadsheets used by Guidehouse to calculate the annual and peak annual electricity demand from residential space and water heating.

d) To calculate the peak hour electricity demand from ASHPs, what temperature(s) did Guidehouse assume for planning/design purposes? Please provide all details and explain the choices made.

e) What temperature(s) at the time of the electricity system peak hour does the IESO use when planning for electricity capacity adequacy?

f) When Guidehouse calculated the impact of ASHPs on the peak and annual electricity demand, did it net out the existing electricity demand from the blower and control systems for a conventional gas heating system? Please explain the choices made.

g) When Guidehouse calculated the impact of ASHPs on the peak and annual electricity demand, did it account for the fact that ASHPs typically reduce a building's summer peak electricity draw through more efficient cooling than traditional air conditioning systems?

h) Please provide a table with a breakdown between air and ground source heat pumps in each scenario for each decade.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Please see response at Exhibit I.1.10-SEC-52 Attachment 1 for a detailed view of the number and proportion of heating system types projected for the Diversified and Electrification scenarios by decade.

b)

i.-ii. The P2NZ study used a top-down approach and did not model the electric consumption or coincident peak demand of individual buildings or individual heat pump systems. Please see response at Exhibit I.1.10-ED-52 parts a-d) for a detailed discussion of how the P2NZ modeled peak system loads.

iii. Please see response at Exhibit I.1.10-ED-52 part f) for a description of outdoor temperatures at the time of electricity system peak.

iv. For the average home with fully electric heat pump space and water heating:

A, C, K Please see Exhibit I.1.10-GEC-24 for a description of system size, COP, and SEER for all electric air-source heat pump systems.
B Guidehouse declines to answer this question because Guidehouse did not make an explicit assumption about the size of backup resistance heaters for air-source heat pumps.
D, F-J, L-O The P2NZ study used a top-down approach and did not model the electric consumption, coincidence factors, or coincident peak demand of individual buildings or individual heat pump systems. Please see response at Exhibit I.1.10-ED-52 parts a-d) for a detailed discussion of how the P2NZ modeled peak system loads.
E Please see response at Exhibit I.1.10-ED-50 part a) for a description of heat pump water heater efficiency assumptions.

v. For the average home with a hybrid system;

A-B, J Please see response at Exhibit I.1.10-GEC-24 for a description of system size, COP, and SEER for hybrid heat pump systems.
C, E-H, I-N The P2NZ study used a top-down approach and did not model the electric consumption, coincidence factors, or coincident peak demand of individual buildings or individual heat pump systems. Please see response at Exhibit I.1.10-ED-52 parts a-d) for a detailed discussion of how the P2NZ modeled peak system loads.
D Please see response at Exhibit I.1.10-ED-50 part a) for a description of heat pump water heater efficiency assumptions.

vii. For the average home with gaseous only heating:

A-B, H Please see response at Exhibit I.1.10-GEC-24 for a description of system size, COP, and SEER for gas heat pump systems.
C-G, I-K The P2NZ study used a top-down approach and did not model the electric consumption, coincidence factors, or coincident peak demand of individual buildings or individual heat pump systems. Please see response at Exhibit I.1.10-ED-52 parts a-d) for a detailed discussion of how the P2NZ modeled peak system loads.

c) The Low Carbon Pathways (LCP) model used in the P2NZ study is a proprietary model developed by Guidehouse and is not available for commercial use. Therefore, Guidehouse declines to provide the model for review. Please see response at Exhibit I.1.10-SEC-48 for details on the form and function of the LCP model.

d) Please see response at Exhibit I.1.10-ED-52 part f) for a description of outdoor temperatures at the time of electricity system peak.

e) Guidehouse declines to answer this question because Guidehouse did not review the IESO's design temperature specification.

f) The P2NZ study used a top-down approach and did not model the electric consumption, coincidence factors, or coincident peak demand of individual buildings or individual heat pump systems.

g) Guidehouse assumed that ASHPs provide more efficient cooling than currently installed air conditioning systems. However, Guidehouse also assumed that widescale electrification via ASHP adoption will lead to a greater proportion of homes using an air conditioning function during summer peak. Statistics Canada reports that in 2019, 82% of homes in Ontario had some type of air conditioning system. Guidehouse assumed that ASHP adoption would increase the saturation of air conditioning systems in Ontario to over 95% of buildings.

h) Please see response at Exhibit I.1.10-SEC-52, Attachment 1 for a detailed view of the number of air-source and ground-source heat pumps projected for the Diversified and Electrification scenarios by decade.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 36

Preamble:

These questions relate to Guidehouse's calcualtion of annual and peak electricity demand arising from space conditioning and water cooling in different scenarios.

Question(s):

a) Please provide a table comparing Guidehouse's inputs and outputs regarding the annual and peak electricity demand arising from a switch to ASHPs with the inputs in the New England ISO's 2022 Analysis found here: https://www.iso-ne.com/static-assets/documents/2022/04/final_2022_heat_elec_forecast.pdf. Note in particular page 26, which suggests a net contribution of approximately 5 kW, not accounting for diversity / coincidence factors.

b) With respect to the regions used for calculating heat pump performance (HSPF & seasonal COP, sCOP), does Guidehouse agree with NRCan that "region 5 would cover most of the southern half of the provinces in Canada" and that "region 5 HSPF is most reflective of heat pump performance in the Ottawa region."

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) The *Pathways to Net-Zero Emissions for Ontario* Study used a top-down approach and did not model the electric consumption or coincident peak demand of individual buildings or individual heat pump systems. Instead, our approach estimated the total province-wide electric consumption of ASHPs and GSHPs that would result from the electrification of residential and commercial heating loads and from the adoption of heat pumps in new construction. Guidehouse does not have individual building estimates to compare to the referenced report from the New England ISO.

b) Guidehouse does not take a position on which regional HSPF is most reflective of heat pump performance in the Ottawa region.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 36

Preamble:

These questions relate to Guidehouse's calcualtion of annual and peak electricity demand arising from space conditioning and water cooling in different scenarios and the assuming efficiencies and forecast future efficiencies of heating equipment.

Question(s):

a) Please complete the following table containing assumptions in Guidehouse's analysis (explicit or implied) regarding technology improvements relating to home heating and cooling. If these assumptions differ between the scenarios, please provide a copy of this table for each scenario.

Guidehouse Forecasts re Heating Technology Improvements				
	2020	2030	2040	2050
Air source heat pump				
Seasonal COP (#)				
COP at time electricity system coincident winter peak (#)				
Electricity demand at time of electricity system coincident winter peak (kW)[1]				
SEER at the time of electricity system coincident peak (kW)				
Equipment cost				
Electric heat pump water heater				
Seasonal COP (#)				
COP at time electricity system coincident winter peak (#)				

[1] Please account for diversity / coincidence and include the total load, including the resistance heating.

Electricity demand at time of electricity system coincident winter peak (kW)[2]				
SEER at the time of electricity system coincident peak (kW)				
Equipment Cost				
Gas heat pump				
Seasonal COP (#)				
COP at time electricity system coincident winter peak (#)				
Electricity demand at time of electricity system coincident winter peak (kW)[3]				
SEER at the time of electricity system coincident peak (kW)				
Equipment Cost				
CCS for blue hydrogen				
Capture rate (%)				
CCS cost ($/PJ)				
Electrolyser for green hydrogen				
Cost ($/PJ)				

b) With respect to the regions used for calculating heat pump performance (HSPF & seasonal COP, sCOP), does Guidehouse agree with NRCan that “region 5 would cover most of the southern half of the provinces in Canada” and that “region 5 HSPF is most reflective of heat pump performance in the Ottawa region.”

c) What are the three most efficient centrally-ducted cold climate air source heat pumps currently available in the North American market with 3-ton capacity? Please complete the following table. (We are seeking this, in part, to compare the best current units with Guidehouse’s forecast of future standard efficiency levels.) If Guidehouse uses a source other than NEEP, please explain why.

Most Efficient Cold Climate Air Source Heat Pumps (Three Ton, Centrally Ducted, North American Market Available)					
	HSPF (IV)	HSPF (V)	sCOP (V)	COP (-25 °C)[4]	Capacity (BTU, -25 °C)[5]
Unit 1					

[2] Please account for diversity / coincidence and include the total load, including the resistance heating.
[3] This would include the circulation fans, outdoor unit, controls, etc. Please account for diversity / coincidence and include the total load, including the resistance heating.
[4] If this precise figure is not available, please provide the COP at the lowest rated temperature.
[5]

Unit 2					
Unit 3					

d) What are the three most efficient centrally-ducted gas heat pumps currently available in the North American market with 3-ton capacity? Please complete the following table. (We are seeking this, in part, to compare the best current units with Guidehouse's forecast of future standard efficiency levels.

Most Efficient Gas Heat Pumps (Three Ton, Centrally Ducted, North American Market Available)					
	HSPF (IV)	HSPF (V)	sCOP (V)	COP (-25 °C)[6]	Capacity (BTU, -25 °C)[7]
Unit 1					
Unit 2					
Unit 3					

e) Please provide a table detailing the improvements in overall efficiency (sCOP), cold climate efficiency, and cold climate capacity of heat pumps since 2000.

f) ISO New England believes that "ASHP technologies deployed in the coming years are expected to improve in terms of their overall coefficient of performance (COP)." Does Guidehouse agree?

g) (j) What is the maximum theoretical COP for an ASHP?

<u>Response:</u>

a) Guidehouse declines to provide COP, electric demand, and SEER at the coincident seasonal peak because these values were not estimated as part of the P2NZ analysis. Guidehouse understands that SEER is a seasonal efficiency metric and cannot be used to quantify system performance at a single point in time. Guidehouse declines to provide equipment costs for heat pump water heaters because the P2NZ Study did not account for the cost of water heater conversions. Guidehouse declines to provide CCS costs and electrolyzer costs on a $/PJ basis because the cost accounting for the P2NZ Study accounted for total costs of green and blue hydrogen production and did not levelized costs on a per-energy basis. The table below provides the seasonal COP and equipment cost by decade.

---

[6] If this precise figure is not available, please provide the COP at the lowest rated temperature.
[7]

Guidehouse Forecasts re Heating Technology Improvements				
	2020	**2030**	**2040**	**2050**
Air source heat pump				
Seasonal COP (#)	2.8	2.9	3.1	3.2
Equipment cost (real 2020$ CAD)	$11,100	$10,545	$9,990	$9,435
Electric heat pump water heater				
Seasonal COP (#)	3	3.2	3.3	3.5
Gas heat pump				
Seasonal COP (#)	1.2	1.3	1.3	1.4
Equipment Cost (real 2020$ CAD)	$12,200	$11,590	$10,980	$10,370
CCS for blue hydrogen				
Capture rate (%)	95%	95%	95%	95%

b) Guidehouse does not take a position on which regional HSPF is most reflective of heat pump performance in the Ottawa region.

c) Guidehouse declines to answer this question because a market scan of cold climate air source heat pumps was outside the scope of the P2NZ analysis.

d) Guidehouse declines to answer this question because a market scan of gas heat pumps was outside the scope of the P2NZ analysis.

e) Guidehouse declines to answer this question because a study of historical heat pump improvements was outside the scope of the P2NZ Study.

f) For the P2NZ Study, Guidehouse assumed that the average seasonal efficiency of new air-source heat pumps, new gas heat pumps, and new electric heat pump water heaters would improve by 15% from 2020 to 2050. These efficiency improvements are reflected in the table provided for (a) above. Guidehouse assumed that these efficiency improvements would progress on a linear path over the 2020 to 2050 time period.

g) Guidehouse declines to answer this question because Guidehouse did not calculate the maximum theoretical COP for an ASHP as part of the P2NZ Study.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 36

Question(s):

Please provide the following figures:

a) Did Guidehouse analyze the capacity of electric thermal storage units to cost-effectively reduce the coincident peak demand of fully-electrified heating systems? If not, why not? If yes, please provide that analysis.

b) Please confirm that there are electric thermal storage units available in Ontario (e.g. those from SSi Energy, Stash, and Steffes).

c) If all heating in homes were to be fully electrified through heat pumps, what would the aggregate co-incident winter peak demand from the heat pumps be (i) without electric thermal storage and (ii) with electric thermal storage?

d) Why did Guidehouse model a 55% penetration rate for gas heat pumps by 2050 but zero penetration for electric thermal storage, even though gas heat pumps are not currently available in the Ontario market (according to Enbridge in its recent DSM proceeding) whereas electric thermal storage units are?

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Guidehouse did not model the adoption of electric thermal storage units. Guidehouse's model of future building sector energy demand focused on interventions that reduce total energy demand (e.g., building retrofits, heat pump conversions, and energy efficiency measures). Guidehouse understands that thermal storage units may shift the time of energy consumption but do not reduce annual energy usage.

b) Guidehouse confirms that SSI Energy, Stash, and Steffes advertise thermal storage products for sale. Guidehouse did not conduct market research to assess the availability of these products in Ontario.

c) Guidehouse modeled the coincident peak load by sector (e.g., buildings, transportation, and industry), but Guidehouse did not model the contributions of individual end uses (e.g., space heating) to the coincident electric peak load. The electric peak load from the buildings sectors is provided for the Diversified scenario, the Electrification scenario, and the Hybrid Heating sensitivity case (sensitivity #4) in Figure 26 of the P2NZ Report. Additionally, as noted above, Guidehouse did not model adoption of electric thermal storage systems.

d) As noted in response to part a), Guidehouse's model of future building sector energy demand focused on interventions that reduce total energy demand. Gas-powered heat pump units are rated at over 100% efficiency and, compared to baseline natural gas furnaces and boilers, gas-powered heat pump units improve heating efficiency and reduce total energy demand. Guidehouse understands that thermal storage units may shift the time of energy consumption but do not reduce annual energy usage.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 36

Question(s):

Please provide the following figures:

a) Annual energy consumption (kWh) from the IESO-controlled grid of an air-source heat pump;

b) An air-source heat pump's kW demand from the IESO-controlled at the time of the IESO-controlled grid's peak winter demand hour;

c) Annual energy consumption (kWh) from the IESO-controlled grid of a ground-source heat pump;

d) A ground-source heat pump's kW demand from the IESO-controlled at the time of the IESO-controlled grid's peak winter demand hour;

e) Time of day of IESO-controlled grid's peak winter demand hour;

f) Outside temperature at time of the IESO-controlled grid's peak winter demand hour;

g) Coincidence demand factor of air-source heat pumps at time of IESO-controlled grid's peak winter demand hour; and

h) Coincidence demand factor of ground-source heat pumps at time of IESO-controlled grid's peak winter demand hour.

Response:

The following response was provided by Guidehouse Canada Ltd.

a-d) The *Pathways to Net-Zero Emissions for Ontario* Study used a top-down approach and did not model the electric consumption or coincident peak demand of individual buildings or individual heat pump systems. Instead, our approach estimated the total province-wide electric consumption of ASHPs and GSHPs that would result from the electrification of residential and commercial heating loads and from the adoption of heat pumps in new construction.

The total province-wide electric consumption from ASHPs is the sum of (1) Consumption from existing ASHP systems, (2) consumption from ASHPs added in new construction, and (3) incremental new ASHP consumption from systems converted from non-HP heating. We also accounted for consumption reductions that result from building shell improvements.

For each decade, we projected and modeled the amount of heating load that would switch from being served by gas, other fuels, or electric resistance heat to being served by ASHPs or GSHPs. For each non-HP system type that was electrified to an ASHP, we used a ratio of system efficiencies to calculate the incremental new ASHP energy consumption that would result from electrification. The following equation represents our ASHP consumption calculations:

$$(\text{\% of load electrified}_{non-HP\ type}) \times (\text{Consumption}_{non-HP\ type}) \times \left(\frac{\text{System efficiency}_{non-HP\ type}}{\text{System efficiency}_{HP\ type}}\right) = \text{Incremental New Consumption}_{HP\ type}$$

where:
non-HP types = natural gas combustion, propane combustion, fuel oil combustion, wood combustion, and electric resistance heating
HP types = air-source heat pump, ground-source heat pump

This method accounts for the inherent efficiency differences between non-HP and HP systems. This calculation was performed at the province-wide level and was not based on a bottom-up analysis of per-building consumption. To estimate hourly electric demand from buildings, our method used a sector-specific 8760-hour load shape to distribute the annual electric consumption for the buildings sector to each hour of the year. This top-down method determines the buildings sector’s contribution to Ontario’s peak electric load, but it does not compute the kW of demand at the scale of an individual heat pump or an individual building.

e) The winter peak hour in the year 2050 is at a different time in the two scenarios /u
modeled in the *Pathways to Net-Zero Emissions for Ontario* Study. In the Diversified
scenario the winter peak in 2050 is in the hour 6:00-7:00pm. The peak hour is late in /u
the day because it is driven by the electric vehicle (EV) charging load shape since, in
this scenario, the limited electrification of building heating means reduces the
influence that building heating demand has on the coincident system peak. In the
Electrification scenario, the winter peak in 2050 is in the hour 7:00-8:00am. This is /u

driven primarily by the electrification of building heat, with some contribution from EV charging.

f) Diversified scenario: The average Winter temperature in the hour 6:00-7:00pm is -2 degrees Celsius. /u

Electrification scenario: The average Winter temperature in the hour 7:00-8:00am is -4.2 degrees Celsius.

This is based on Toronto historical weather. Source: Environment Canada, Average hourly temperature (degrees Celsius) over the 5-year period from 2017-2021 (inclusive)

g-h) As noted above, this study used a top-down approach. Our method did not directly calculate or employ coincidence demand factors for air-source or ground-source heat pumps, and we did not calculate the consumption or the contribution to peak demand from individual heat pumps at the building scale. Rather, our demand forecasts began with a reference case forecast of annual electric consumption (by sector and end use) and a scenario case forecast of annual natural gas consumption (by sector and end use) from Enbridge Gas's ETSA Study. Guidehouse estimated the scenario case total annual electric consumption in Ontario based on assumptions about interventions that improve energy efficiency, that displace methane with low-carbon gases, and that electrify gas-powered end uses. The response to questions (a)-(d) above describes how our high-level method estimates the annual consumption of electricity from ASHPs. As noted above, we estimated hourly electric demand by distributing the annual electric consumption forecast for each sector using a sector-specific 8760-hour load shape.

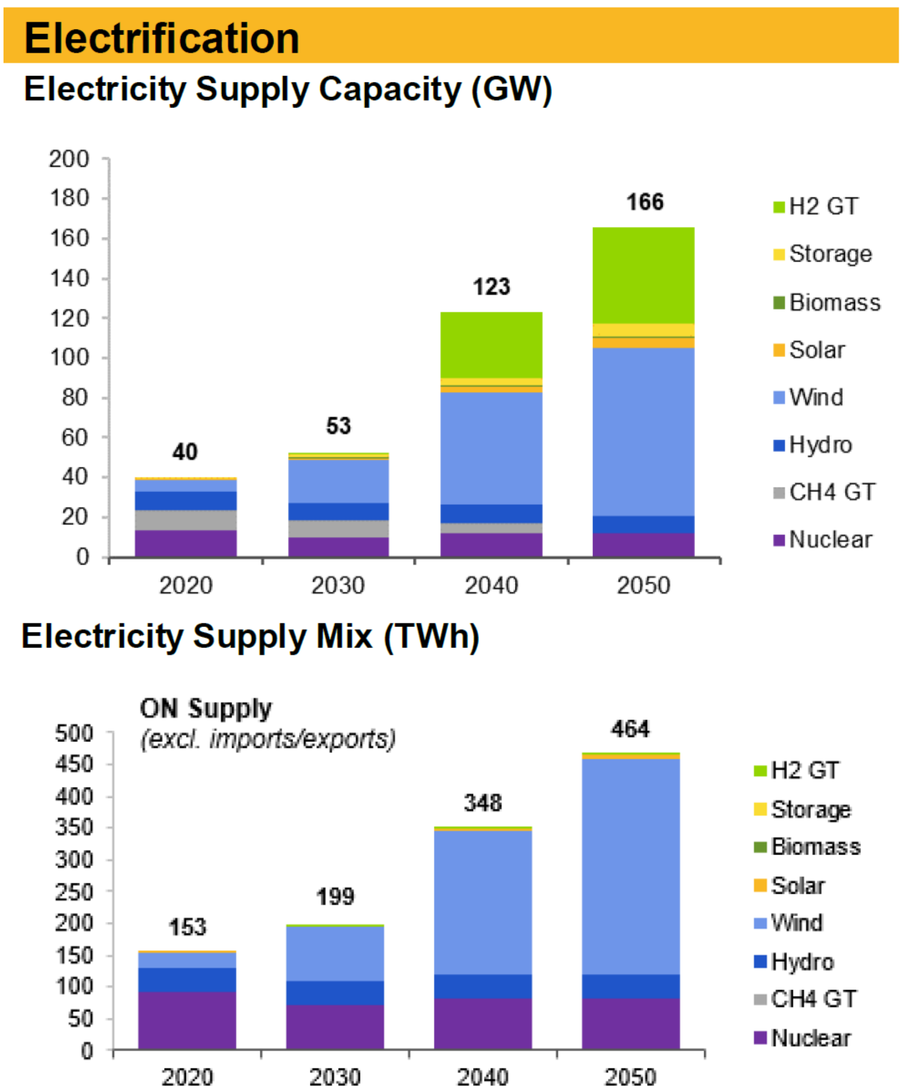
Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 36

Preamble:



Question(s):

a) Please provide a table comparing Guidehouse's estimates of the cost of storage capacity with the cost of capacity from vehicle-to-grid/building technology based on the IESO's DER Potential Study:

b) Please provide the cost-effective potential from vehicle-to-grid/building technology in 2020, 2030, 2040, and 2050 based on extrapolation from the IESO's DER Potential Study.

c) Approximately many vehicles are there in Ontario? {ADD FOOTNOTE] What is the technical potential for vehicle-to-grid/building technology by 2040 based on the number of vehicles in Ontario, an appropriate average battery size (e.g. 75 kWhs), and an estimate of the percent of vehicles that are electrified by 2040 (e.g. 90%)?

d) Please provide a table comparing Guidehouse's estimate of the average and marginal cost of zero-emitting resources with the average and marginal cost of the zero-emitting resources outlined in the IESO's DER Potential Study:

e) Please provide the cost-effective potential from DERs in 2020, 2030, 2040, and 2050 based on extrapolation from the IESO's DER Potential Study.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Guidehouse's estimate of the cost of battery storage technology is included in Table A-11 of the P2NZ Study and includes capital costs of installation (CONE) and fixed O&M costs (FOM) in 2030, 2040, and 2050. Guidehouse declines to compare the battery storage cost assumptions from the P2NZ Study to the IESO's estimates for V2B/G technology provided in the IESO Distributed Energy Resources (DER) Potential Study,[1] because Guidehouse has not independently verified the findings of the IESO DER Potential Study.

b) Guidehouse declines to answer this question because the IESO DER Potential Study provides estimates of measure-level potential in the year 2032 (Figure 5-7 in the IESO report), but the report provides no basis for interpolation or extrapolation of these estimates.

[1] IESO (2022). "Distributed Energy Resources (DER) Potential Study." Available at: https://www.ieso.ca/-/media/Files/IESO/Document-Library/engage/derps/derps-20220930-final-report-volume-1.ashx

c) Guidehouse declines to answer this question because the Guidehouse transportation demand model for Ontario is specified in terms of passenger-kilometers and not in terms of vehicle counts. Guidehouse has not assessed the potential for vehicle-to-grid/building technology. Guidehouse estimates that, of the passenger-kilometers travelled in cars, approximately 67% of passenger-kilometers will be served by electrified transportation by 2040.

d) Guidehouse declines to answer this question because the analysis conducted for the P2NZ Study did not calculate the average or marginal costs of individual electric generating resources. Instead, the Low Carbon Pathways model estimates the total economy-wide cost of new generation resources by accounting for the capital cost of installing each resource (the cost of new resource, or CONE) and the fixed and variable operations & maintenance costs (FOM and VOM) associated with using each generation resource. Table A-11 of the *Pathways to Net Zero Emissions for Ontario* Study contains the CONE, FOM, and VOM assumptions for all of the modeled resources. However, these values are not comparable to the IESO's method of cost reporting.

e) Guidehouse declines to answer this question because the IESO DER Potential Study provides estimates of total DER potential in the years 2023, 2027, and 2032 (Table 5-6 of the IESO report), but the report provides no basis for interpolation or extrapolation of these estimates.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 36

Question(s):

a) Please complete the following table comparing the Guidehouse forecasts for the price of hydrogen power generation versus storage:

Guidehouse Cost Forecasts Regarding Peak Power Resources – Storage vs. Hydrogen				
	2020	2030	2040	2050
Hydrogen power generation – blue hydrogen				
Capacity ($/MW, levelized)				
Energy ($/MWh)				
Hydrogen power generation – green hydrogen				
Capacity ($/MW, levelized)				
Energy ($/MWh)				
Efficiency (%)[1]				
Grid-scale battery storage				
Capacity ($/MW, levelized)				
Energy ($/MWh)				
Efficiency (%)[2]				

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Guidehouse declines to answer the questions regarding unit costs of green hydrogen and blue hydrogen production. The purpose of the P2NZ report was to

[1] Efficiency is [power input into the electrolyser]/[power generated from the resulting hydrogen], accounting for all losses involved in the electrolysis, storage, transportation, and power generation steps.
[2] Efficiency is [power input into the battery]/[power drawn from the battery], accounting for all losses involved therein.

estimate the total costs for each scenario to achieve net-zero emissions by 2050. To estimate total costs, Guidehouse accounted for the capital cost of new hydrogen production projects (CONE), the fixed O&M costs (FOM) of operating hydrogen production capacity regardless of output, and the variable O&M costs (VOM) which scale based on production volume. Table A-11 of the P2NZ study provides these costs for the renewable electric generation capacity and electrolyzers used to produce green hydrogen, and for the steam methane reformation used to produce blue hydrogen.

Guidehouse did not estimate a cost per unit production of green hydrogen or blue hydrogen, as the intent of the study was not to model commodity costs or market prices for hydrogen.

For battery storage technologies, Guidehouse took a similar approach and estimated the capital cost of new battery installations and the costs of operating battery capacity. Table A-11 of the P2NZ study provides the CONE and FOM costs for battery capacity.

Guidehouse cannot determine the levelized cost of capacity or the cost per unit production of hydrogen and batteries from the output of our Low Carbon Pathways model because these costs would include other project parameters (e.g., taxes, cost of financing, etc.) that we have not estimated.

Table 1 provides Guidehouse's assumptions regarding the efficiency of hydrogen and battery technologies. Guidehouse declines to provide the full lifecycle efficiency of hydrogen generation, storage, and consumption. The P2NZ analysis accounted for efficiency losses at each of these steps but did not include a holistic lifecycle analysis of hydrogen efficiency.

Table 1
P2NZ Assumptions Regarding Efficiencies of Hydrogen and Battery Technologies

	2020	2030	2040	2050
Green hydrogen production				
Electrolyzer Efficiency (%)[3]	71%	71%	76%	80%
Hydrogen Salt Cavern Storage (%)[4]	99%	99%	99%	99%
Hydrogen-Fired Gas Turbines (%)[5]	42%	42%	42%	42%
Grid-scale battery storage				
Battery Efficiency (%)[6]	85%	85%	85%	85%

[3] Electrolyzer Efficiency is [energy content of hydrogen produced]/[power input into the electrolyser], accounting for losses involved in electrolysis.
[4] Salt Cavern Storage Efficiency is [hydrogen withdrawn from storage]/[hydrogen placed in storage]
[5] Gas Turbine Efficiency is [electric power output of turbine]/[energy content of hydrogen consumed]
[6] Battery Efficiency is [power drawn from the battery]/[power input into the battery].

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

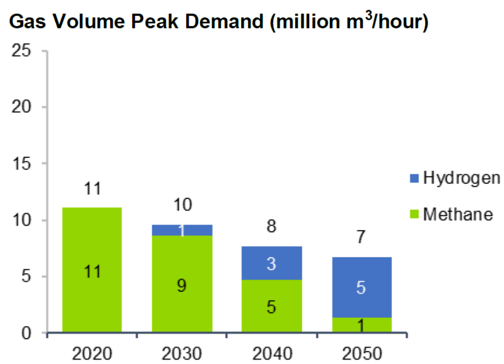
Issue:

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 38

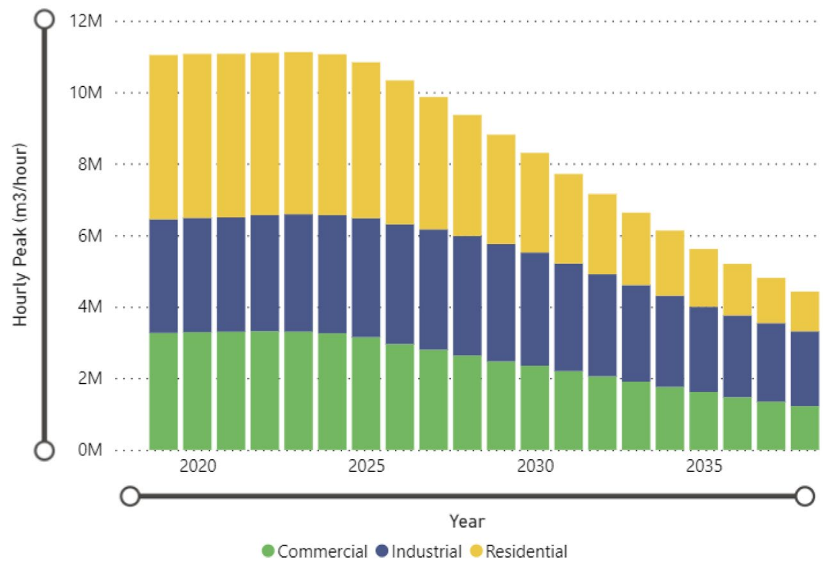
Preamble:

Electrification scenario peak demand per page 38 of the Guidehouse report:



Electrification scenario peak demand per the Posterity Group report at Exhibit 1, Tab 10, Schedule 5, Attachment 1, Page 72:

Exhibit 62 - Electricity Centric Scenario: Peak Hour by sector



Question(s):

a) Please provide a table reconciling the above figures. If necessary, please communicate with the Posterity Group to obtain the underlying data. Please explain any differences.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) The referenced charts describe different scopes of analysis. The chart from Posterity Group's Report projects the peak hour gas volumes that would be delivered by Enbridge Gas, and the projection from Posterity Group does not include gas demand from other sectors of the economy (e.g., transportation and industry) that may or may not be served by Enbridge Gas's gas network. Guidehouse's *Pathways to Net Zero Emissions for Ontario* Study describes gas volume peak demand for the whole province of Ontario, which includes gas end uses that may or may not be served by Enbridge Gas. As illustrated in Figure 8 of the P2NZ Report, the gas demand from the transportation and industry sectors are a substantial portion of gas demand, and the proportional consumption of these sectors is projected to increase over time. The Guidehouse figure also includes indirect gas demand that would be consumed for the production of blue hydrogen and for electric power generation. These indirect gas demand streams are described in Figure 15 of the P2NZ Report, under the subheading "Supply Mix for Direct & Indirect Gas Demand." Since the scope of the

Guidehouse chart is larger than and includes the scope of Posterity Group’s chart, it is logical that the peak volumes in the Guidehouse chart are larger than those in Posterity Group’s chart.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. B-1

Preamble:

“This study expands on previous energy transition scenario analysis (ETSA) done by Enbridge Gas that forecasts gas demand from 2020 to 2038. More specifically, this study expands the Enbridge Gas forecasts from 2038 to 2050 and develops electricity demand scenarios that are internally aligned with the underlying assumptions of Enbridge Gas’s gas forecasts. This section describes the forecasting methodology and presents the gas and electricity demand forecasts for the Diversified and Electrification scenarios. The Diversified and Electrification scenarios are intended to represent plausible, potential future visions of the Ontario energy system by 2050. They are not intended to represent the most optimal or perfect scenarios.”

Question(s):

a) It is unclear from the Guidehouse report which aspects of the scenarios were determined by Enbridge as part of its energy transition scenario analysis and which aspects were determined by Guidehouse through its own optimization. Please provide a table for each scenario listing all of the assumptions (including the values for assumptions) that were exogenous to Guidehouse’s work.

b) Why did Guidehouse not explore a scenario that did not rely on gaseous fuels delivered by pipelines, such as electrification where possible supplemented by hydrogen created onsite?

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Appendix A of the *Pathways to Net Zero Emissions for Ontario* provides tables of assumption values and clearly cites the values that were provided by Enbridge. The table below summarizes the sources of key modeling parameters employed in the study.

Modeling Parameter	Source
Natural gas price forecast	Determined by Guidehouse, based on Dawn Hub consensus forecast
Carbon price forecast	Sourced from ETSA
Discount rate	OEB guidance
Overall scenario definitions and high-level implications for the buildings, industry, transportation, and power sectors	Determined by Guidehouse, with input from Enbridge Gas subject matter experts
Estimated gas savings in the buildings sector due to retrofit building codes	Sourced from ETSA
Forecasts of natural gas, RNG, and hydrogen demand for Enbridge's gas system, for 2020-2038	Sourced from ETSA
Forecasts of economy-wide natural gas, RNG, and hydrogen demand for Ontario, for 2020-2050	Determined by Guidehouse
Forecasts of annual electricity consumption and peak electricity demand	Determined by Guidehouse
Forecasts of conversions of space conditioning and water heating technologies in the buildings sector	Determined by Guidehouse
Forecasts of conversions of transportation sector technologies	Determined by Guidehouse
Forecasts of conversions of industrial sector technologies	Determined by Guidehouse
Equipment efficiency ratings	Determined by Guidehouse
Electric generation capacity expansion	Determined by Guidehouse

b) The scope of work requested by Enbridge Gas included a detailed exploration and expansion of two ETSA scenarios through the 2050 timeframe with a target of net-zero emissions in 2050. Guidehouse did not consider additional scenarios outside the scope of work requested by Enbridge Gas.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

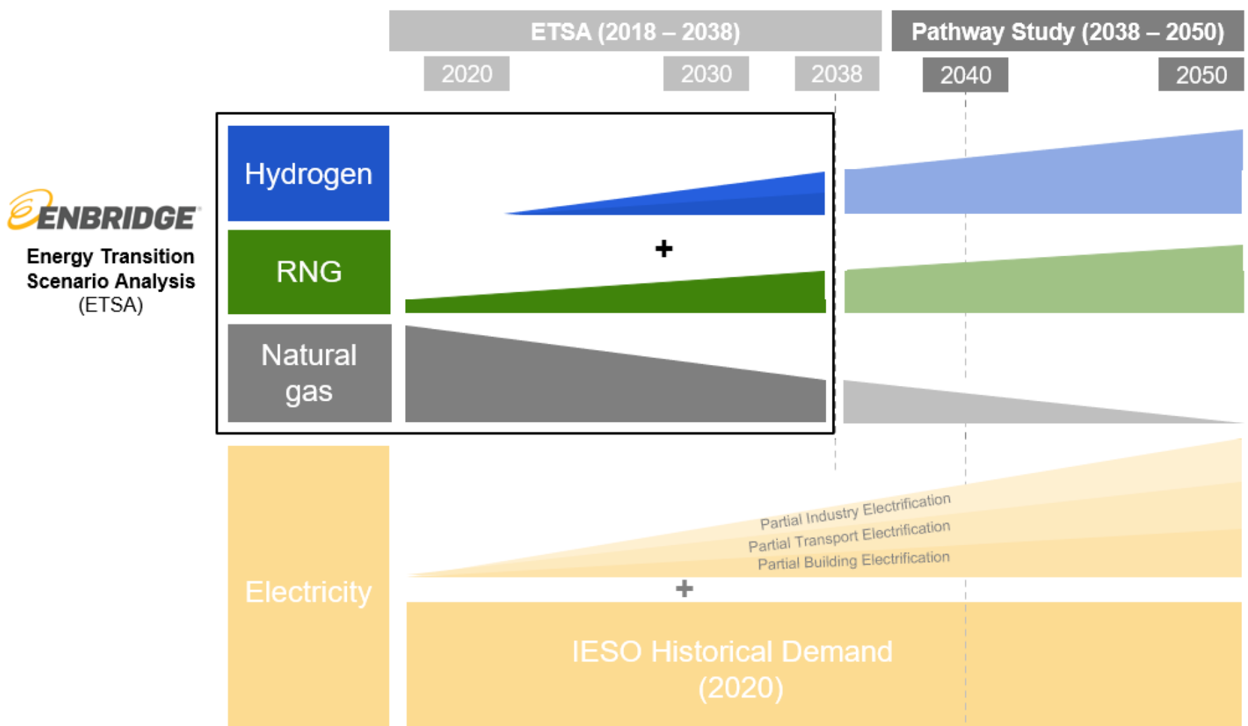
Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. B-1

Preamble:

Figure B-1. Graphical Representation of the Extrapolation Used to Develop the Demand Scenarios



Question(s):

a) Figure B-1 is a "Graphical Representation of the Extrapolation Used to Develop the Demand Scenarios." Please explain how this graphic can represent both scenarios.

b) When Guidehouse extrapolated the scenarios from the Enbridge ETSA, did it do so by maintaining the rate of increase or decrease in each fuel type constant as suggested by this graphic.? If not, please explain.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) In the *Pathways to Net Zero Emissions for Ontario* Study, Figure B-1 is conceptual in nature and is intended to illustrate that beyond the ETSA study period, the consumption of natural gas will continue to decline while the consumption of electricity, RNG, and hydrogen will continue to increase. This trend is true in both the Diversified and Electrification scenarios, albeit with different magnitudes of increase and decrease.

b) When Guidehouse extrapolated the scenarios from the Enbridge Gas ETSA, the extrapolations beyond the ETSA study period were guided by the requirement to achieve net-zero emissions by 2050. The extrapolations were not linear in shape as suggested by the conceptual illustration in Figure B-1.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 35

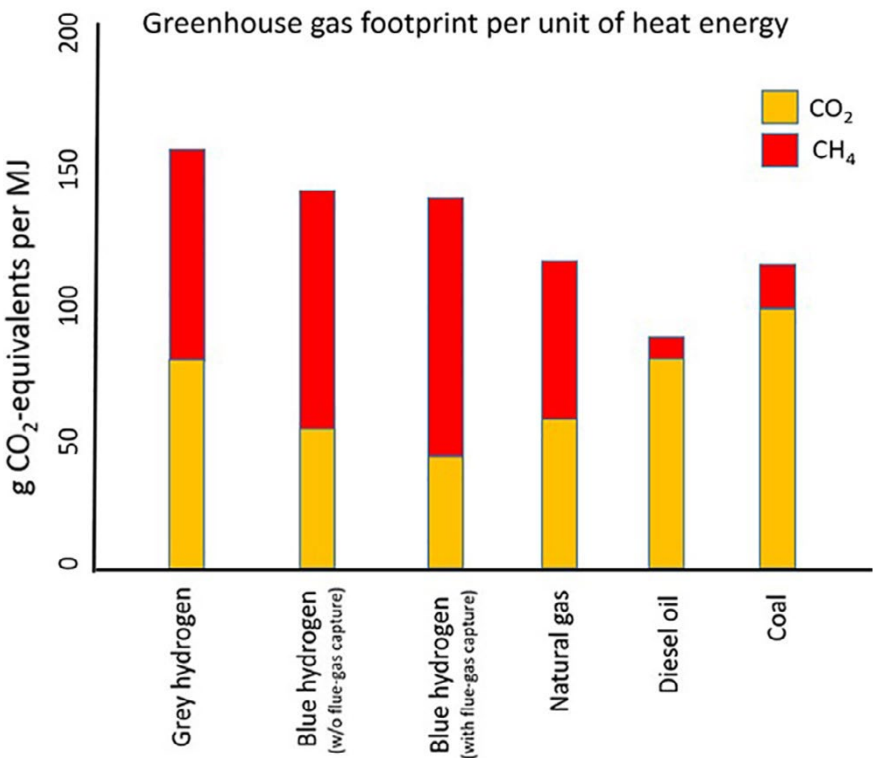
Preamble:

“Both scenarios require a large scale-up in wind capacity and hydrogen-fired gas turbines”

Question(s):

a) As detailed in the below figure from a peer-reviewed study published in an academic journal, electricity generated from blue hydrogen actually results in more carbon emissions than standard methane gas-fired generation.[1] Please produce a table comparing Guidehouse’s assumptions to the assumptions in that peer-reviewed study. In doing do, please separately address each of the figures Table 1 from the study, listing the figure from the study and Guidehouse’s different assumptions.

[1] Robert W. Howarth and Mark Z. Jackson, “How green is blue hydrogen?” *Energy Science & Engineering*, 26 July 2021; https://onlinelibrary.wiley.com/doi/epdf/10.1002/ese3.956



b) Wherever Guidehouse's assumptions in response to (a) are materially different, please describe the basis of Guidehouse's assumption versus the basis in the paper.

c) Please comment on the following conclusion from the report: "As we have demonstrated, far from being low emissions, blue hydrogen has emissions as large as or larger than those of natural gas used for heat (Figure 1; Table 1; Table 2). The small reduction in carbon dioxide emissions for blue hydrogen compared wit natural ga are more than made up for by the larger emissions of fugitive methane."

Response:

The following response was provided by Guidehouse Canada Ltd.:

a-c)

- Guidehouse reviewed the referenced study and determined that the study's findings regarding emissions from blue hydrogen production are overstated. The overall emissions rate of blue hydrogen production is fairly impactful to the results of the Pathways to Net-Zero Emissions for Ontario (P2NZ) Study, since a high emissions rate would make blue hydrogen less economical as an early source of hydrogen capacity. Guidehouse highlights the following points as they are the most impactful drivers of the referenced study's overstated emissions:

- **The referenced study uses 20-year global warming potential (GWP) values, instead of the standardly used 100-year GWP.** The current Intergovernmental Panel on Climate Change (IPCC) standard is to use 100-year GWP values, and the emissions factors in the P2NZ study are cited to sources that use a 100-year GWP as a basis for estimating the CO_2-equivalent emissions of fugitive upstream emissions. For reference, the 100-year GWP value for methane is 28, while the 20-year GWP value is 86[2] so the referenced study's use of a 20-year GWP will yield estimates of CO-equivalent emissions from fugitive methane that are nearly three times higher than impacts estimated with 100-year GWP values.

- **The referenced study assumes significant upstream methane leakage, mostly from gas extraction.** The referenced study assumes 3.5% methane leakage from extraction to end-use. In contrast, Enbridge Inc. has stated a goal of voluntarily reducing methane emissions across the value chain to 1% or less by 2025.[3] The P2NZ analysis uses a methane leakage rate of 0.4% as an average value over the 2020-2050 study period.

- **The referenced study assumes a CO2 capture rate of 85% from CCS.** The P2NZ Study assumes a CCS capture of 95%.

- In total, for blue hydrogen production, the referenced study assumes an emissions factor of 135 gCO_2e/MJ and the P2NZ Study assumes an emissions rate of 5.6 gCO_2e/MJ. For another point of comparison, a 2018 study from CE Delft[4] estimated that the CO_2 footprint of blue hydrogen is about 6.8 to 9.3 gCO_2e/MJ.

---

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Issue:

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 43

Preamble:

"Finally, end-user costs are $56 billion higher compared to the Diversified scenario. End-user costs are higher because of the high penetration of electric heat pumps which require significant upfront investment in equipment for geothermal heat pumps and costly building retrofits to maintain the same level of comfort for air-source heat pumps.88"

Question(s):

a) Are the above-noted building retrofits cost-effective?

b) Please provide the aggregate energy costs savings arising from the above-noted retrofits from 2020 to 2050. Where are these energy cost savings accounted for in the Guidehouse analysis, if anywhere?

c) Please provide the aggregate energy costs savings arising from the above-noted retrofits over the lifetime of those measures that accrue beyond 2050.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Assessing the cost effectiveness of building retrofits requires a projection of future utility rates for electricity ($/kWh) and gas service ($/GJ). In the *Pathways to Net Zero Emissions for Ontario* Study, Guidehouse assessed costs on an economy-wide basis and did not project the utility rates that customers will pay for energy. Thus, Guidehouse is unable to assess the cost-effectiveness of the building retrofits assumed in the analysis. Guidehouse notes that, in addition to utility rates, the cost-effectiveness of building retrofits will depend on federal incentives and other cost socialization measures that may be introduced in the future but are outside the scope of the study's cost analysis.

b) As noted above, the Guidehouse analysis assessed costs on an economy-wide basis. Cost reductions associated with building retrofits were estimated as follows. Guidehouse used an energy demand model for the buildings sector to estimate how building retrofits would reduce annual energy use for the buildings sector as a whole. Using these projections of annual energy use along with sector-specific electric load shapes, Guidehouse projected the coincident peak electric load in Ontario for each sector included in the analysis (buildings, transportation, and industry). These projections of coincident electric peak informed our capacity expansion modeling, which determined the amount of new electric generation capacity that will be needed to meet electric loads in the future. These forecasts of capacity expansion informed the Guidehouse cost analysis, which accounted for capital and operating expenses of the future energy system.

   Put simply, building retrofits lead to lower annual electric consumption in the buildings sector, which leads to lower coincident peak electric demand, which reduces the amount of new electric generating capacity needed, which reduces the costs estimated for building and operating new electric generation facilities. The cost reductions resulting from reduced energy use due to building retrofits are reflected in the "Electric System Costs" reported in Figure 18 of the *Pathways to Net Zero Emissions for Ontario* report provided at Exhibit 1, Tab 10, Schedule 5, Attachment 2.

c) Guidehouse declines to answer this question because Guidehouse assessed costs on an economy-wide basis and did not project the utility rates that customers will pay for energy.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Issue:

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 43

Preamble:

"In the middle decade from 2030 to 2040, however, emissions costs are $49 billion higher in the Electrification scenario than in the Diversified scenario. This is because in that decade, carbon emissions will still be significant, and the price of carbon will have risen significantly. The Electrification scenario uses a higher projected price of carbon compared to the Diversified scenario, resulting in higher emissions costs in that decade."

Question(s):

a) Carbon pricing is a transfer, not a cost. The funds are returned to Ontarians. Should it not be excluded from the analysis?

b) Please describe the methodology used by Guidehouse in its analysis in terms of the traditional tests (TRC, SCT, etc.).

c) Please provide a table with a breakdown of the carbon cost included in figure 18 on page 44 for each scenario per decade and total.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) This analysis treated carbon tax as a cost that will be borne by Ontarians. This perspective is supported by a 2022 Parliamentary Budget Office Report, which concluded that most households will experience a net loss of income from the federal carbon tax, when accounting for both direct and indirect costs.[1]

b) Guidehouse did not employ cost-benefit methodologies in conducting the *Pathways to Net Zero Emissions for Ontario* study.

c) The tables below include the requested breakdown of carbon costs by decade.

Diversified Scenario

	2020	2030	2040	2050	
Carbon Emissions by Source (million tCO2e / decade)					
Renewable natural gas	0.00	0.01	0.03	0.05	/u
Biomass with CCS	0.00	0.00	0.00	-2.40	/u
Natural gas with CCS	0.00	0.27	0.64	0.75	/u
Natural gas imports	51.25	48.35	25.53	0.00	/u
Hydrogen from natural gas + CCS	0.00	0.87	1.63	1.60	/u
Carbon cost per tonne (2020$/tCO2e)	$27.50	$136.38	$138.78	$138.78	
		2020-2030	**2031-2040**	**2041-2050**	
Total Emissions Cost by Decade (2020$CAD)		$23 B	$65 B	$35 B	/u

Electrification Scenario

	2020	2030	2040	2050	
Carbon Emissions by Source (million tCO2e / decade)

Electrification

Billion CAD, real 2020$

	2020-30	2030-40	2040-50	Total
Gas System	35	40	44	**119**
Elec. System	170	147	149	**466**
Emissions	30	115	46	**191**
End Users	15	89	66	**170**
Total	**250**	**391**	**305**	**946**

Question(s):

a) Where are RNG and fossil gas costs included in the above?

b) Please provide a live excel spreadsheet with as detailed of a breakdown of the above figures into their constituent parts as possible.

c) Where are the costs of the new hydrogen transmission and distribution costs included in the above? How much are the costs of the new hydrogen transmission and distribution infrastructure by decade and total by 2050?

Response:

The following response was provided by Guidehouse Canda Ltd.:

a) The costs associated with RNG production and conventional natural gas supply are included under "Gas System Costs".

b) Please see response at Exhibit I.1.10-GEC-20, Attachment 1 for a breakdown of cost categories into constituent parts.

c) The costs associated with new hydrogen transmission are categorized as Gas System costs. The cost of developing hydrogen transmission pipelines is provided in response at Exhibit I.1.10-GEC-20. Guidehouse declines to provide costs for distribution pipelines in Ontario because distribution pipeline costs are outside the scope of the P2NZ Study, and because a more detailed regional analysis is needed to understand how new hydrogen networks would develop depending on where demand centers develop geographically and potential opportunities for collocated supply.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, 44

Preamble:

Figure 18:

Diversified

Billion CAD, real 2020$

	2020-30	2030-40	2040-50	Total
Gas System	48	58	71	**177**
Elec. System	132	108	114	**354**
Emissions	23	66	31	**120**
End Users	19	54	41	**114**
Total	**221**	**286**	**258**	**765**

Electrification

Billion CAD, real 2020$

	2020-30	2030-40	2040-50	Total
Gas System	35	40	44	**119**
Elec. System	170	147	149	**466**
Emissions	30	115	46	**191**
End Users	15	89	66	**170**
Total	**250**	**391**	**305**	**946**

Question(s):

a) Please reproduce the above figure with cost of carbon pricing removed from the figures.

b) Please reproduce the above figure adding 2050-2070. Please do so on a best-efforts basis, making any simplifying assumptions as necessary. The purpose, in part, is to explore whether one scenario has longer-lived assets that may become more cost-effective over a longer time horizon (e.g. wind power and building retrofits, which have substantial up-front costs but produce benefits for many years).

c) Please reproduce the above figure on the assumption that fully electrified homes heating with heat pumps contribute 5 kW to the system peak from 2020 to 2040 and 4 kW from 2040 to 2050 (net of their existing, baseline contribution). Please do so on a best-efforts basis, making any simplifying assumptions as necessary. Please provide all calculations and assumptions.

d) Please reproduce the above figure on the assumption that the RNG potential in Ontario is 41 PJ and that the difference is made up by the most cost-effective alternative,

<u>Response:</u>

The following response was provided by Guidehouse Canada Ltd.:

a) The table provides a summary of scenario costs with a subtotal row that omits emissions costs. Guidehouse notes that these scenario cost results were developed using a cost optimization function that includes the carbon prices presented in Table A-2 of the P2NZ report. Guidehouse declines to re-run the Low Carbon Pathways model with a zero carbon price input, because a zero carbon price scenario is outside the scope of this analysis and because additional model runs are not feasible in the time allocated for interrogatory responses.

Table: Reproduction of P2NZ Figure 18 with Carbon Pricing Removed (Billion CAD, Real 2020$)

Diversified Scenario					**Electrification Scenario**					
	2020-2030	**2030-2040**	**2040-2050**	**TOTAL***		**2020-2030**	**2030-2040**	**2040-2050**	**TOTAL***	
Gas System	50	69	77	**197**	Gas System	40	47	45	**132**	/u
Electricity System	116	93	100	**308**	Electricity System	122	110	109	**341**	/u
End User Costs	19	32	2	**53**	End User Costs	15	51	3	**70**	/u
Subtotal	185	194	179	**558**	Subtotal	177	208	158	**543**	/u
Emissions Costs	23	65	35	**122**	Emissions Costs	27	108	44	**179**	/u
Total*	**207**	**259**	**214**	**681**	Total*	**205**	**316**	**202**	**722**	/u

* Totals may not sum exactly due to rounding

b) Guidehouse declines to answer this question, because the demand models and pathways model used for this analysis are not designed to estimate past 2050. Guidehouse notes that the Low Carbon Pathways model includes calculations to account for assets with lifetimes that extend beyond the study period. For assets with lifetimes that extend beyond the study period, the LCP model discounts the upfront capital costs associated with the buildout of new capacity based on the salvage value of assets at the end of the study period (in this case, the year 2050). The LCP model distributes these end-of-lifetime salvage discounts evenly across the asset's lifetime within the study period. Effectively, the LCP model only incurs new asset costs for the portion of the new assets' lifetime that falls within the study period.

c) Guidehouse declines to answer this question because our models are configured to estimate demand using a top-down approach and our models do not forecast demand on a building-by-building basis.

d) Guidehouse declines to answer this question because doing so would require recalibrating and rerunning the LCP model, which is out of scope for this analysis and is not feasible in the time allowed for developing interrogatory responses.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 45

Preamble:

"Electricity system costs include … new or reinforced T&D infrastructure."

"Costs for expanding and upgrading gas and electricity distribution systems (last-mile delivery) are out of scope."

Question(s):

a) Please reconcile the above two sentences as they relate to electricity distribution.

b) Please assess the cost of developing the hydrogen-only transmission and distribution pipelines required in Ontario for the scenarios

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) The analysis for the P2NZ Report includes the following costs related to electricity: electricity system interjurisdictional transmission (e.g., between ON and others), capital cost assumptions for new electric generation resources (e.g., new wind and solar) including the costs to connect those resources to the grid, the cost of operation existing electric generation facilities and electric transmission infrastructure, and the cost of new in-province electric transmission.

   The analysis for the P2NZ Report does not include the cost of new electric distribution (CAPEX or OPEX) within Ontario, the cost of electrical upgrades on a premise-by-premise basis (i.e., the analysis excludes the cost of upgrading electric circuits and breaker panels).

b) The cost of developing interregional hydrogen-only transmission pipelines and repurposing existing interregional gas pipelines to carry hydrogen is provided in response at Exhibit I.1.10-GEC-20. Guidehouse declines to provide costs for /u distribution pipelines in Ontario. Costs for upgrading methane distribution pipelines to accept hydrogen blending and for the hydrogen distribution system within Ontario are outside the scope of the P2NZ analysis and not included. This is because a more detailed regional analysis is needed to understand how new hydrogen networks would develop depending on where demand centers develop geographically and potential opportunities for collocated supply.

ENBRIDGE GAS INC.

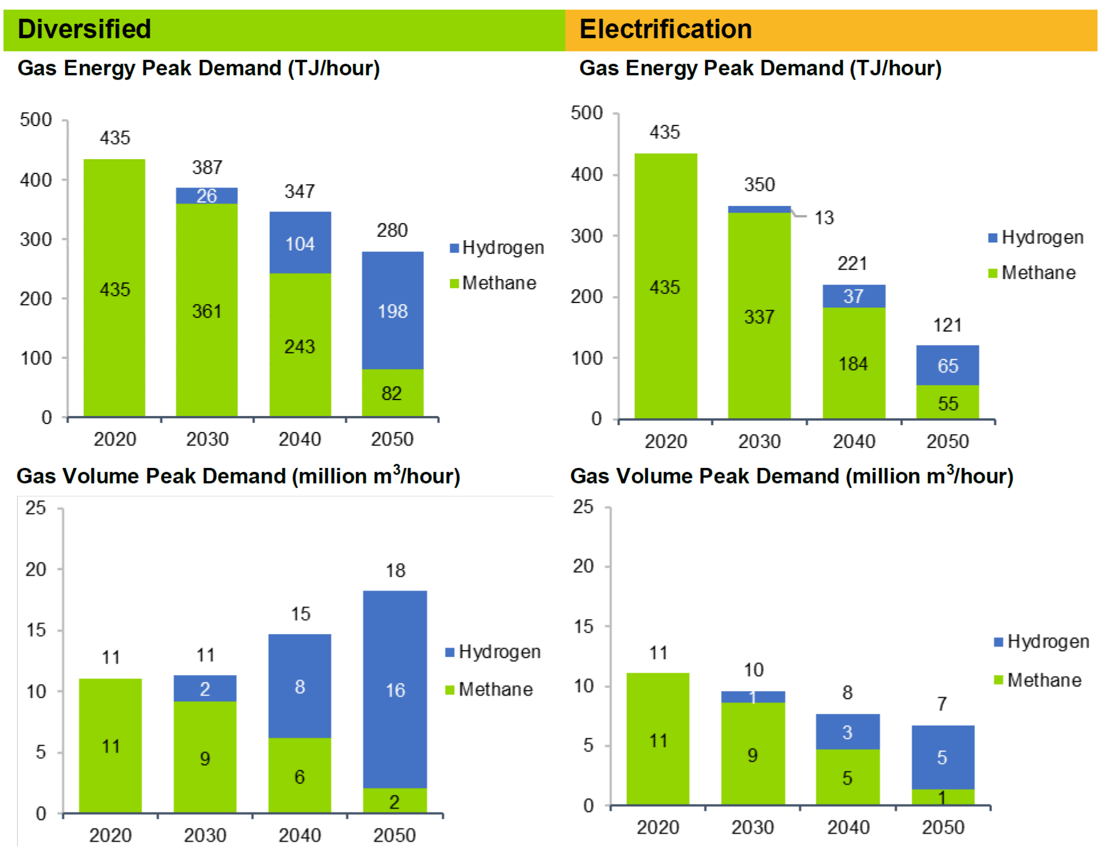
Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 38 & 44-45

Preamble:



Question(s):

This question will require assistance from Enbridge in relation to the categorization of its pipelines as between transmission and distribution pipelines.

a) Please complete the below table detailing the methane and hydrogen gas pipeline capacity requirements in each scenario, expressed in TJ/hour.

Ontario Methane and Hydrogen Pipeline Capacity Requirements (TJ/hour)				
	2020	2030	2040	2050
Gas transmission pipelines – methane only				
Gas distribution pipelines – methane only				
Gas transmission pipelines – methane & hydrogen blend				
Gas distribution pipelines – methane & hydrogen blend				
Gas transmission pipelines – dedicated hydrogen				
Gas distribution pipelines – dedicated hydrogen				

b) Please complete the below table detailing the methane and hydrogen gas pipeline capacity requirements in each scenario, expressed in million/hour.

Ontario Methane and Hydrogen Pipeline Capacity Requirements (million m3/hour)				
	2020	2030	2040	2050
Gas transmission pipelines – methane only				
Gas distribution pipelines – methane only				
Gas transmission pipelines – methane & hydrogen blend				
Gas distribution pipelines – methane & hydrogen blend				
Gas transmission pipelines – dedicated hydrogen				
Gas distribution pipelines – dedicated hydrogen				

c) Please reproduce the table in (b), indicating in brackets in each cell which pipelines are included in the Guidehouse cost estimates and which are not.

d) Please make best efforts to estimate the gas pipeline costs that are not already included in the Guidehouse analysis, including, if applicable, the cost to build a new hydrogen distribution system.

e) Please complete the below table detailing the methane and hydrogen gas pipeline requirements in each scenario, expressed in kms.

Ontario Methane and Hydrogen Pipeline Length Requirements (km)				
	2020	2030	2040	2050
Gas transmission pipelines – methane only				
Gas distribution pipelines – methane only				
Gas transmission pipelines – methane & hydrogen blend				
Gas distribution pipelines – methane & hydrogen blend				
Gas transmission pipelines – dedicated hydrogen				
Gas distribution pipelines – dedicated hydrogen				

Response:

The following response was provided by Guidehouse Canada Ltd.:

The P2NZ study used a high-level approach to analyze future capacity needs on a province-wide scale. The scope of the P2NZ study was not sufficiently granular to estimate intra-regional distribution. As such, the tables below present Guidehouse's estimates of province wide gas network capacity and do not distinguish between transmission and distribution capacity.

The values provided in this response represent Ontario-wide estimates developed in the P2NZ study to study the cost of Ontario's energy transition. The values provided in this response are not reflective of the current or future planned capacities of Enbridge Gas Inc.'s gas transmission or distribution systems.

a) Please see the tables below, Table 1 for the Diversified Scenario, and Table 2 for the Electrification Scenario

Table 1
Diversified Scenario Gas Pipeline Capacity Requirements

Ontario Methane and Hydrogen Pipeline Capacity Requirements (TJ/hour)					
	2020	2030	2040	2050	
Gas system capacity requirements – methane only	437	356	-	-	/u
Gas system capacity requirements – methane & hydrogen blend	-	-	260	87	/u
Gas system capacity requirements – dedicated hydrogen	0	26	105	198	/u

Table 2
Electrification Scenario Gas Pipeline Capacity Requirements

Ontario Methane and Hydrogen Pipeline Capacity Requirements (TJ/hour)					
	2020	2030	2040	2050	
Gas system capacity requirements – methane only	437	332	-	-	/u
Gas system capacity requirements – methane & hydrogen blend	-	-	185	56	/u
Gas system capacity requirements – dedicated hydrogen	0	13	37	62	/u

b) Please see the tables below, Table 3 for the Diversified Scenario, and Table 4 for the Electrification Scenario.

Table 3
Diversified Scenario Gas Pipeline Capacity Requirements

Ontario Methane and Hydrogen Pipeline Capacity Requirements (million m3/hour)					
	2020	2030	2040	2050	
Gas system capacity requirements – methane only	11.2	9.2	-	-	/u
Gas system capacity requirements – methane & hydrogen blend	-	-	6.7	2.2	/u
Gas system capacity requirements – dedicated hydrogen	-	2.1	8.7	16.3	/u

Table 4
Electrification Scenario Gas Pipeline Capacity Requirements

Ontario Methane and Hydrogen Pipeline Capacity Requirements (million m3/hour)					
	2020	2030	2040	2050	
Gas system capacity requirements – methane only	11.2	8.5	-	-	/u
Gas system capacity requirements – methane & hydrogen blend	-	-	4.8	1.5	/u
Gas system capacity requirements – dedicated hydrogen	-	1.0	3.0	5.1	/u

c) Please see table below.

Table 5
Ontario Methane and Hydrogen Pipeline Capacity Requirements

	2020-2050
Gas transmission pipelines – methane only	Existing and incremental new pipelines are included (though the modeling shows the Diversified and Electrification scenarios would not need new methane transmission pipeline)
Gas distribution pipelines – methane only	Existing pipelines are included; Incremental new pipelines are not included
Gas transmission pipelines – methane & hydrogen blend	None exist today. Conversion of existing methane pipelines is included
Gas distribution pipelines – methane & hydrogen blend	Existing and incremental new pipelines are not included
Gas transmission pipelines – dedicated hydrogen	Existing and incremental new pipelines are included
Gas distribution pipelines – dedicated hydrogen	Existing and incremental new pipelines are not included

d) Guidehouse declines to answer this question because a more detailed regional analysis is needed to understand how new hydrogen networks would develop depending on projections of regional demand centers and potential opportunities for collocating supply with demand. Guidehouse notes that the P2NZ cost analysis also excludes investments in the electricity distribution system.

e) Guidehouse declines to provide lengths of in-province transmission and distribution pipeline, because Guidehouse modeled the costs of in-province pipelines on a capacity basis. Please reference Exhibit I.1.10-GEC-24(h) for lengths of interregional gas pipelines.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 38 & 44-45

Question(s):

These questions are primarily for Enbridge:

a) Enbridge describes its gas peak demand as 11 million m3/hour. What is the peak capacity of Enbridge's gas system, expressed in million m3/hour?

b) What is the total capital cost of Enbridge's pipeline system in Ontario expressed as $ per million m3/hour of capacity?

c) What is the levelized cost of Enbridge's pipeline system in Ontario, including capital and operating costs, expressed as $ per million m3/hour of capacity?

Response:

a-c) The capacity of the Enbridge Gas system, and calculations which include the capacity, cannot be provided because the gas system is complex and interconnected. Capacity is influenced by a variety of factors, including different pressure subsystems, stations, new customer attachments, existing customer demand changes and the locations of these changes. The assessment of Enbridge Gas's system to adequately supply the needs of its customers is done through load capture, demand forecasts, and complex hydraulic models. The hydraulic models contain not only the demands but also the locations of these demands and the pipes that serve them. This allows for the assessment of the health of the model, specifically in its ability to serve the volume and pressure required. The capacity for any system to accept new demands is dependent on the location, volume, and pressure required. As a result, there is a multitude of scenarios and varying results for each subsystem dependent on where the capacity is assessed. Please see response at Exhibit I.1.10-GEC-57 for the referenced peak gas demand.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, p. 38 & 44-45

Question(s):

a) This question is for Guidehouse: Please provide a table showing the annual cost for Ontario gas transmission and distribution in each scenario from 2020 to 2050.

b) This question is for Enbridge: Please provide the response to (a) and derive the implied annual revenue requirement.

Response:

a)The following response was provided by Guidehouse Canada Ltd.:

Guidehouse calculated the costs of gas transmission on a decade basis and cannot provide costs on an annual basis as requested. Response at Exhibit I.1.10-GEC-20, Attachment 1 provides the costs of new hydrogen transmission pipeline, which include both the capital and operating costs of interprovince and intraprovince transmissions systems. Note that there are no new capital investments in natural gas transmission pipelines in either scenario.

The costs of gas distribution system expansion and conversion were outside the scope of the P2NZ study and are not provided.

The costs presented in response at Exhibit I.1.10-GEC-20, Attachment 1 are based on estimates of O&M costs developed by Guidehouse and Guidehouse's independent estimate of future gas network capacity specific to the scenarios analyzed in the P2NZ report. The capacity and cost estimates do not represent gas system capacity forecasts developed by Enbridge Gas Inc.

b) Enbridge Gas declines to provide a response. As stated in the response to part a) above, the costs presented are based on estimates developed by Guidehouse that represent an estimate of the total investments required in the pipeline system in Ontario. There is no distinction between what investments could be made by

Enbridge Gas versus other parties, such as low-carbon fuel suppliers, and distribution system costs are not included in the cost estimates. It is therefore not possible to determine Enbridge Gas's implied revenue requirement.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2

Preamble:

Per the Ontario Association of Fire Chiefs: “More than 50 people die each year from carbon monoxide poisoning in Canada, including 11 on average in Ontario.”

Question(s):

a) Does Guidehouse agree that a decarbonization pathway that involves fully electrifying homes in Ontario could save approximately 11 lives each year by preventing carbon monoxide poisoning from homes? If not, please provide the estimated lives saved in a decarbonization pathway that involves full electrification of space and water heating through avoided carbon monoxide poisoning

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Guidehouse did not model the health impacts resulting from residential building electrification. The modeling of health impacts is outside the scope of the *Pathways to Net Zero Emissions for Ontario* Study

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Issue:

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2, A-10

Preamble:

“Gas Heat Pump with A/C Unit [CAD$/unit] $12,200”

Question(s):

a) Guidehouse’s estimate for a gas heat pump originates from Enbridge. Please independently estimate the cost of a gas heat pump and provide the results.

b) Please provide a list of Gas Heat Pumps available on the market in Ontario, the price (equipment and install), the seasonal COP, and the COP at -20°C.

c) Please provide a list of Gas Heat Pumps available on the market in the United States, the price (equipment and install, converted to CAD), and seasonal COP, and the COP at °C

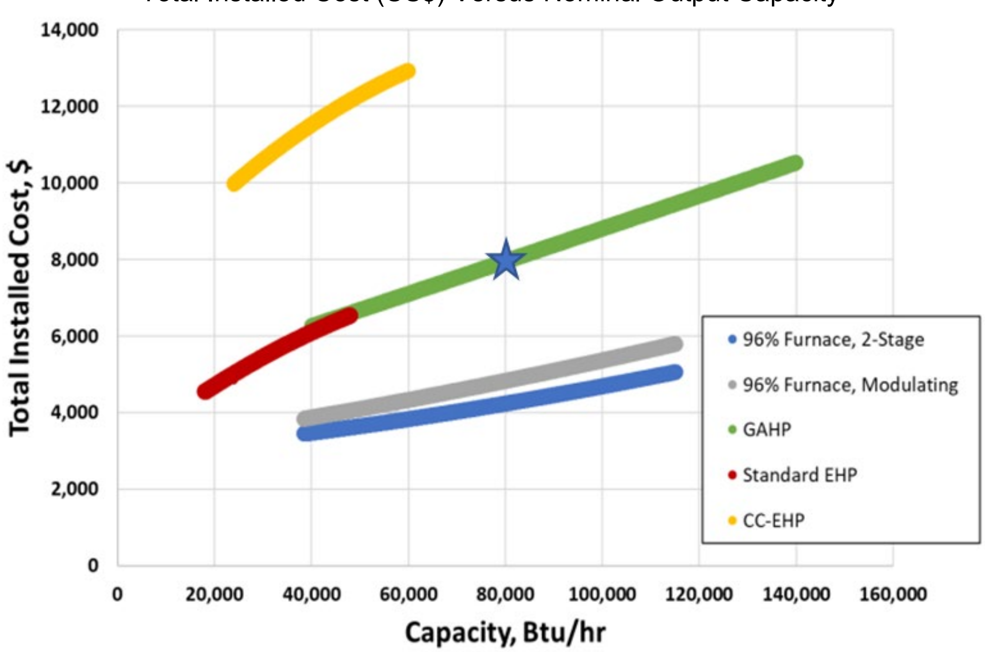
Response:

The following response was provided by Guidehouse Canada Ltd.:

a) In Table 4 of the P2NZ report provided at Exhibit 1, Tab 10, Schedule 5, Attachment 2, Guidehouse presents an assumption of $12,200 for a gas heat pump with low-capacity air conditioning unit. This cost estimate was determined based on a cost curve provided by Stone Mountain Technologies, Inc., a manufacturer of gas heat pumps.[1] This cost curve is reproduced below, with a point indicating the total installed cost assumed in the P2NZ study for a USD$8,000 (CAD$10,800) gas heat pump. Guidehouse assumed the gas heat pump installation may be accompanied by multiple room A/C units for total cost of $12,200.

[1] Stone Mountain Technologies Inc. (2021). “Gas Absorption Heat Pumps.” Filed in 2021-11-15, EB-2021-0002, Exhibit I.10i.EGI.CCC.40, Attachment 1, p.10 of 160. Available at: https://www.rds.oeb.ca/CMWebDrawer/Record/732115/File/document.

Figure: Residential Forced-Air Heating Installed Costs.
Total Installed Cost (US$) Versus Nominal Output Capacity[1]



To confirm the reasonableness of this estimate, Guidehouse met with a gas heat pump manufacturer and discussed their commercialization and market entry plans. Guidehouse also reviewed a technology summary from the US DOE[2] and a technology briefing from GTI.[3]

b-c) Guidehouse has not independently compiled a list of gas heat pump models available in the US/Canada, and Guidehouse has not independently attempted to procure and install gas heat pumps in Ontario. Guidehouse referred to a 2019 Gas Technology Institute industry roadmap, which indicates that several manufacturers have commercially available gas heat pump products in the US and Canada.[4] In addition to manufacturers with available product, the roadmap also indicates that several other manufacturers are in the pre-commercial stage and expect to introduce gas heat pump products to market in the next 1-5 years. Figure 2 of the roadmap indicates that residential gas heat pumps from Robur have an efficiency rating of 129% AFUE, and commercial gas heat pumps from Yanmar and Intellichoice have COP_gas ratings of 1.3 to 1.4. Guidehouse declines to provide the COP at various temperatures for these models because Guidehouse has not compiled performance curves for these models.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2

Question(s):

a) Please provide a map of Ontario showing the location of industrial facilities that require a high-grade heat that cannot be electrified.

b) Please provide any reports or analysis comparing the cost-effectiveness of on-site or local electrolysers versus green hydrogen delivered by a dedicated pipeline system for that purpose.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) This *Pathways to Net Zero Emissions for Ontario* Study was conducted at a high level, with assumptions about electrification potential for different sub-sector industries based on the proportion of industrial energy used for different purposes (e.g., energy used for HVAC, process heat, etc.). The analysis did not map individual or consider energy usage on an individual customer basis.

b) Guidehouse did not conduct a cost comparison regarding the geographic location of electrolyzers. Such a cost comparison would involve analysis at a sub-provincial granularity that was outside the scope of this study.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2

Question(s):

Please respond to the following comments on the Guidehouse report:

a) The Guidehouse report does not study or assess the cost for a full electrification scenario wherein (i) investment in province-wide pipeline infrastructure is reduced over time to zero, (ii) hard-to-electrify sectors convert to hydrogen via as on-site electrolyser, a nearby electrolyser (e.g. with short-distance distribution), storage, and/or trucked fuel, (iii) the remaining sectors electrify, and (iv) cost-effective methods are adopted to decrease peak and annual electricity resource requirements (e.g. thermal storage, V2G/B, etc.).

b) The Guidehouse analysis does not extend beyond 2050 to account for the benefits of investments with long-lived benefit streams. It therefore is biased against investments with significant up-front costs that have a stream of future benefits with low or no ongoing costs. Those include, for example: building envelope energy efficiency, wind power, solar power, investments in electricity transmission and distribution infrastructure.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) This statement does not contain a question. Guidehouse confirms that the *Pathways to Net Zero Emissions for Ontario* Study does not examine a scenario wherein investment in province-wide pipeline infrastructure is reduced over time to zero.

   Guidehouse did not conduct a cost comparison regarding the geographic location of electrolyzers. This involves analysis at a sub-provincial granularity that was outside the scope of this study, and a regional study that maps potential hydrogen hubs would be useful to test the most economical approach to hydrogen network development. In a prior study of hydrogen network development in the European

Union,[1] Guidehouse found that it can be more cost effective to co-locate green hydrogen production with renewable energy generation and transmit hydrogen to demand centers, rather than transmitting electricity to on-site hydrogen generation.

Guidehouse did model cost effective methods to reduce peak load in both scenarios. For example, Guidehouse implicitly accounted for the impact of demand response in the transportation sector when developing the demand forecasts. Guidehouse estimated that the managed charging of electric vehicles will be an impactful demand response measure that will shape the hourly electric load profile of the transportation sector. To implicitly account for the impact of demand response, the analysis used separate electric load shapes for the buildings and transportation sectors that do not have coincident peaks.

b) This statement does not contain a question and Guidehouse does not confirm the statement. The Low Carbon Pathways model includes calculations to account for assets with lifetimes that extend beyond the study period. For assets with lifetimes that extend beyond the study period, the LCP model discounts the upfront capital costs associated with the buildout of new capacity based on the salvage value of assets at the end of the study period (in this case, the year 2050). The model distributes these end-of-lifetime salvage discounts evenly across the asset's lifetime within the study period. Effectively, the LCP model only incurs new asset costs for the portion of the new assets' lifetime that falls within the study period.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5

Question(s):

a) Natural Resources Canada provides the following Natural Gas Conversions:

Approximate Natural Gas Conversions				
	‹- Multiply by -›			
	m^3	cf	MMBtu	GJ
Cubic Metres (m^3)		35.301	0.0353	0.0373
Cubic Feet (cf)	0.0283		0.001	0.001055
Million British thermal units (MMBtu)	28.3278	1000		1.0551
Gigajoules (GJ)	26.853	947.817	0.9478	

For example, to convert from 1 MMBtu to Gigajoules, multiply by 1.055.[1]

Please confirm whether Enbridge believes those conversion rates are (i) accurate and ii) the same as the conversion rates used in its application. If not, please (i) reproduce the table with the rates that Enbridge used for its application and (ii) provide the rates that Enbridge believes are accurate.

b) Please provide the following figures and conversion factors:

i. tCO2e/m3 methane gas (combustion, Ontario)
ii. m3 of hydrogen with the equivalent energy of 1 m3 of methane gas
iii. $/m3 hydrogen to equivalent of $/m3 methane gas (i.e. equivalent energy content)
iv. 1 kg hydrogen to 1 m3 hydrogen
v. 1 kg hydrogen to 1 J hydrogen
vi. $/kg hydrogen to $/m3 hydrogen

c) Please complete the following conversion tables.

Response:

a) The Natural Resources Canada conversion rate table provided in the question is replicated as Table 1, with amendments provided below. The remaining conversion rates (without notes) are the same as the original table provided in the question.

Table 1
Approximate Natural Gas Conversions

	‹- Multiply by -›			
	m3	cf	MMBtu	GJ
Cubic Metres (m3)		35.315(5)	0.03702 (4)	0.03908 (1)
Cubic Feet (cf)	0.0283		0.00105 (3)	0.00111 (2)
Million British thermal units (MMBtu)	27.012 (4)	953.94 (3)		1.0551
Gigajoules (GJ)	25.58854 (1)	903.65 (2)	0.9478	

Notes:

(1) The values for the conversions between GJ and cubic metres have been updated to reflect the heat value of natural gas specified in this Application: 38.86 MJ/m3 or 39.08MJ/m3 are used for Enbridge Gas North or Enbridge Gas South zones, respectively as provided at Exhibit 3, Tab 6, Schedule 1 paragraph 3). For simplicity, only the 39.08MJ/m3 value is used.

(2) Updated conversion rate between cubic feet and GJ as a result of the updated heat values in note (1).

(3) Updated conversion rate between cubic feet and MMBtu as a result of the updated heat values in note (1).

(4) Updated conversion rate between cubic metres and MMBtu as a result of the updated heat values in note (1).

(5) The conversion rate between cubic metres and cubic feet was incorrectly recorded in the original table provided in the question as 35.301; the correct value is 35.315, as sourced from the CER website in footnote 3.

b) The following conversions are provided in response:

i. The Ontario combustion conversion for 1m^3 of natural gas to tonnes of carbon dioxide equivalent (tCO2e) emissions is 0.001932 tCO2e/m3 of residential/commercial marketable natural gas[2].

ii. Please see response at Exhibit I.4.2-ED-127.

iii. On a pure energy basis equivalency only with energy sold in GJ, a conversion of energy values regardless of cost for: 1 m^3 of hydrogen ≈ 0.0127 GJ of hydrogen. The relevancy would be the unit cost of one of the energy carriers. For hydrogen, it is necessary to know the delivered cost of hydrogen to provide a cost for the equivalent amount of energy contained in 1 m^3 of natural gas. This will be different for hydrogen producers as there is currently no standard pricing as with natural gas. Natural gas on a volumetric basis has approximately 3X the volumetric energy density of hydrogen.

This cost for hydrogen on an energy equivalency basis is not comparable to the cost of natural gas. Natural gas is currently produced at scale, well established, has a mature distribution system and must meet a singular requirement for pipeline grade quality. Conversely hydrogen for blending (renewable or low carbon hydrogen) is not at scale and can be produced in several ways, different grades and purity. For each variant, the cost would be different.

iv. 1 kg of hydrogen is ~11.126 Nm^3 of hydrogen (Nm^3 gas measured at 0°C and 101.325 kPaa) or ~11.9 sm^3 of hydrogen (sm^3 gas measured at 15°C and 1 atm)

v. Using the HHV for hydrogen: 1 kg of H_2 ≈ 141,900,000 J H_2
Using the LHV for hydrogen: 1 kg of H_2 ≈ 120,000,000 J H_2

vi. To convert from $/kg of hydrogen to $/m3, a price could be applied to the conversion factors in part iv. Considering the uncertainty in market prices no assumed price is available.

c) For tables entitled “Watt and Joules”, “Watt and Joules – Hourly", Watts and Joules - Price, the conversion seeks to convert power to energy or energy to power, which cannot be done.

For the tables titled “Methane Gas” Enbridge Gas is unable to provide conversion rates as Enbridge Gas does not distribute pure methane gas. As an alternative, for conversion rates related to natural gas, hydrogen and other fuels, Enbridge Gas

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2

Question(s):

This question is for Guidehouse:

a) For the day corresponding to the winter peak demand, please provide the (i) peak hour demand (MW) for that peak day and (ii) the average hourly demand for that peak day. Please provide those figures for 2020, 2030, 2040, and 2050. Please make and state any simplifying assumptions as necessary to answer the question and state any caveats.

b) For an air-source heat pump, what is the difference between the peak hour demand on the peak winter day and the average hourly demand on the peak winter day? Please provide the underlying calculations.

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Hourly winter peak electric loads by scenario and by decade are provided in Attachment 1. Table 1 provides the winter peak hours and the peak hour electric demand by scenario and decade. Note that in the Electrification scenario, the peak hour shifts to the morning due to building heating electrification. In the Diversified scenario, the peak also shifts to the morning in 2040 due to building heating /u
electrification, but then shifts to the evening in 2050 due to transportation /u
electrification resulting in evening charging since there is less building heating /u
electrification.

Table 1
Winter Peak Hour Electric Demand

Scenario	Decade	Hour Ending	Peak Hour Demand (MW)	Average Peak Day Demand (MW)	
Diversified	2020	18:00	21,525	19,333	
	2030	19:00	32,421	30,331	/u
	2040	8:00	42,565	40,093	/u
	2050	19:00	51,057	47,708	/u
Electrification	2020	18:00	21,525	19,333	
	2030	8:00	37,965	35,252	/u
	2040	8:00	68,283	62,550	/u
	2050	8:00	82,143	76,553	/u

b) Guidehouse declines to answer this question because Guidehouse used a top-down approach to energy modeling in the Pathways *to Net-Zero Emissions for Ontario* Study, and the study did not model the electric consumption or coincident peak demand of individual buildings or individual heat pump systems.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 5, Attachment 2

Question(s):

These questions are for Guidehouse:

a) Does Guidehouse agree that the cost of green hydrogen depends on the cost of net-zero power?

b) What does Guidehouse assume for the cost of green hydrogen in 2050 ($/PJ)? Please provide a copy of or link to the study or report that serves as the basis for this assumption. Please indicate the cost of net-zero power ($/MWh, levelized) assumed in that study or report used to generate the green hydrogen at the relevant price point?

c) What does Guidehouse assume for the average and marginal cost of net-zero power ($/MWh, levelized) in 2050 in its modelling?

Response:

The following response was provided by Guidehouse Canada Ltd.:

a) Guidehouse agrees that the cost of green hydrogen depends on the cost of net-zero power.

b-c) Guidehouse declines to answer this question because the *Pathways to Net Zero Emissions for Ontario* Study did not forecast a market price for green hydrogen. The purpose of the *Pathways* study was to assess economy-wide costs of different approaches to achieving net-zero GHG emissions in Ontario by 2050.

The study assessed economy-wide costs that would be incurred to construct and operate the zero emissions electricity generation resources (e.g., solar and wind power) and the hydrogen production resources (e.g., electrolyzers) needed to produce sufficient hydrogen to meet demand in the future.

The Guidehouse Low Carbon Pathways model accounts for hour-to-hour changes in hydrogen demand, the electricity supply mix, periods of surplus electricity generation, and other factors. The impacts of all these factors are modelled endogenously to estimate the total electric and hydrogen generation capacity required to meet Ontario's future energy demand in different scenarios. However, the study did not attempt to isolate the cost of green hydrogen production from the economy-wide analysis.

Similarly, when assessing the cost of net-zero power generation, the *Pathways* analysis estimated the capital and operating costs of producing electricity from renewable sources to assess costs on an economy-wide scale, but the study did not estimate the levelized cost of net-zero power.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 2, p. 2; Exhibit 1, Tab 10, Schedule 5, p. 22

Preamble:

Question(s):

a) Enbridge states that: “an electrification pathway to net-zero will require massive investment in new electrical generation, transmission, storage and distribution systems, and end user equipment.” If all homes in Ontario were fully electrified with heat pumps, how much could the peak winter demand (MW) be reduced through electric thermal storage units (e.g. those from SSi Energy, Stash, and Steffes)[1]?

b) Please describe the incentives available for Electric Thermal Storage in Quebec, Nova Scotia, and PEI.

c) Enbridge states that: “an electrification pathway to net-zero will require massive investment in new electrical generation, transmission, storage and distribution systems, and end user equipment.” If all homes in Ontario were fully electrified with heat pumps, how much could the peak winter demand (MW) be reduced through V2G/B technology?

Response:

a),c) Enbridge Gas undertook the Pathways to Net-Zero Emissions for Ontario Study provided at Exhibit 1, Tab 10, Schedule 5, Attachment 2, to examine two different, but plausible, pathways to achieve net-zero in Ontario, including the role that low and zero carbon fuels could play in combination with low emitting electricity in achieving net-zero emissions. As the energy transition unfolds, there will be many technologies that could be leveraged along a pathway toward a net-zero economy. Due to cost and time constraints, it was not possible to model every possible permutation of how net-zero could be achieved in Ontario, or to consider every type of technology that may be used in the future.

[1] See https://www.ssie.ca/products/, https://stash.energy/en/product/, and https://www.steffes.com/ets/comfort-plus-forced-air/.

The referenced technologies were not included in the P2NZ Study and, therefore, Enbridge Gas cannot speculate on how the peak winter electricity demand might change resulting from the use of the referenced technologies.

b) Enbridge Gas is not familiar with the incentives available in other jurisdictions regarding the referenced technologies and, therefore, declines to describe them here.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 4, Page 20, 3.4. Rate Setting, Paragraph 60

Preamble:

"Enbridge Gas is proposing a straight fixed variable with demand (SFVD) rate design to be used for the proposed harmonized general service customer classes. SFVD rate design consists of a customer charge and a demand charge which matches the cost to provide delivery service to each customer by reflecting the demand that each customer imposes on the network and the cost of being connected to the network".

Question(s):

Does SFVD significantly reduce EGI volume risk? If so, why is EGI stating volume risk is increasing.

Response:

The statement about exacerbated volumetric risk provided at Exhibit 1, Tab 10, Schedule 4, page 19, part c) was not meant to be narrow and specific to declining volumetric end-use consumption, but should rather be interpreted as including the risk of customers leaving the system, new customers not attaching to the system in favor of another energy source, as well as, the risk of declining volumetric consumption, and potentially declining peak day demand.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 4, Page 20, Paragraphs 60-62

Question(s):

a) How many gas and electric utilities in Canada have straight fixed variable with demand (SFVD) rate design? Please list these.

b) How many US gas and electric utilities have straight fixed variable with demand (SFVD) rate design? Please list these with and indicate the States served.

c) For each of Union and EGI please indicate how much of fixed costs are included in the customer charge and how much in consumption?

d) For each of Union and EGI please indicate how much of fixed costs are included in the customer charge and how much in the proposed demand charge?

e) Does not SFVD reduce the risks of recovery of fixed costs?

f) Comment if this would lead to a lower Equity Ratio - other factors not considered?

Response:

a-d) This issue will be addressed in Phase 2 of the proceeding in accordance with the OEB's Decision on Issues List dated January 27, 2023.

e-f) As provided at Exhibit 8, Tab 2, Schedule 3, the Straight Fixed Variable with Demand (SFVD) rate design recovers fixed costs through fixed charges. The fixed customer-related costs are recovered in the monthly customer charge, the capacity or demand-related costs are recovered in a monthly demand charge, and variable costs are recovered in volumetric charges.

The recovery of fixed customer-related and demand-related costs in fixed charges results in less recovery risk in delivery charges due to weather and average use variances compared to the current rate design. The Company's delivery revenue is subject to an average use true up mechanism, but there is currently no true up for weather variances. As a result, the current rate design may result in lower or higher delivery revenue than the SFVD rate design due to weather variances caused by warmer or colder weather.

There are no proposed changes to Enbridge Gas's equity thickness due to the proposed SFVD rate design, consistent with the approach for Ontario electric utilities. At Exhibit 8, Tab 2, Schedule 3, page 14, paragraph 41, Enbridge Gas confirms that the SFVD rate design alternative is aligned with the fully fixed rate design approach that the OEB approved for Ontario electric utilities and that electric utilities have since implemented for their customers.

Enbridge Gas notes that the OEB has not made any change to Ontario electric utilities' equity thickness, which has remained at 40%, or to Return on Equity (ROE), in light of fully fixed rate design for distribution service.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 1, Tab 10, Schedule 2, Page 24, Paragraph 59

Preamble:

"To better understand the potential future electricity demand and capacity needs, the IESO is undertaking a Pathways to Decarbonization study and demand scenario. This study will be used to explore the implications of operating Ontario's electricity system under significantly higher demand with a non-emitting supply mix. It is anticipated that the report will be available in November of 2022."

Question(s):

Please file a copy of the *Pathways to Decarbonization Study* report to the Minister of Energy, dated December 15, 2022, so that it is on the record in this proceeding.

Response:

The Pathways to Decarbonization Study is publicly available on the IESO's website[1].

[1]Pathways to Decarbonization, December 15, 2022, https://www.ieso.ca/en/Learn/The-Evolving-Grid/Pathways-to-Decarbonization.
